>Any info?..Live dead, looking good or ??

It sounds weird but none of these developers are reading
neither here nor in the German Mausnet. Sounds strange
for someone who wants to develop an internet-software
for the Atari-community.

I had a demo version installed once. It was in an early
stage and I didn't like the design of the GUI.
Otherwise it was faster than CAB.
Didn't use it online.

Very sad that this promising project has been canceled.
The cards from Phase5 are excellent, would be even a
great job if someone would add this cheap 060-board
to a Falcon ...

1885. Re: Zip Plus SCSI woes

Newsgroup: comp.sys.atari.st
Date: 1998-01-29 00:00:00 UTC
From: Ben Hall <cb170@city.ac.uk>
Message-ID: <Pine.GSO.3.95q.980129231610.3529A-100000@exeter>
Source record: 108870
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi all,

Okay, here's the latest on my Zip woes - to recap, I'm trying to get a Zip Plus drive to work on the SCSI chain after my Link 2/MiniS hard drive.

After some help from Karl Brant from System Solutions, I've managed to locate and remove the termination from the MiniS drive. So now, I've got:

Atari ---> Link 2 ---> MiniS (no termination) ---> Zip Plus

The Zip Plus is supposed to automatically set its own termination, so, problems over, you'd think. Hmmm...

With the Zip Plus connected, the SCSI communication "works" but is extremely unreliable. Both HD Driver 7.1 and the ICD 6.5.5 driver software read garbled data - sometimes the Link is not detected, othertimes it detects the Link but displays the drive data with errors - for example, in normal use the driver software reports that the MiniS is a "Maxtor 7213-SCSI" drive, which is correct. With the Zip plugged in, this usually is reported as something like:

"Maxxrr 7343/SSSI"
or "MXXor 7724--SSIO" or other garbled text
(it's different every time)

indicating something is seriously wrong with the SCSI communication. Unplugging the Zip and leaving the Zip SCSI lead dangling improves the SCSI communication - there is still the odd error in about 1 in 4 tries (in other words, I get "Maxtor 7213-SCSI" mostly, sometimes "Maxtor 7213-SSSI").

Using IDCHECK.PRG which scans each SCSI id and reports the names of any connected drive, I do occasionally (about 1 in 30 tries) find a "IOMEGA ZIP 100" drive, but normally no drive is detected on id 5 or 6, which is what the Zip can be set to. The Zip Plus is supposed to autodetect whether it needs termination or not and automatically do it, but I'm wondering if this is perhaps a result of the Zip not terminating itself? I've tried various combinations of power-up sequences between the peripherals and computer and nothing seems to make a difference.

Have you guys got any suggestions?

Why the hell do you do that ? There is really NO motivation at all to do
this. You do not need to touch it at all unless you got LAN connections.

So have the port inactive by default, and your comms problems will be gone.

> so before I use it I have to boot under TOS. To this end I have a Kobold

Yes you can. Even the TT's SCC is DMA driven, so even two of the serial ports
do DMA.

> described. ;^)

The buffer buffers data. It a temporary storage that holds data coming in from the serial ports in a continous manner, until STinG got another CPU timeslice to take out and process the data, which happens in a burst like manner.

It's save to assume that the net rate of processing is the same as the average rate of incoming data, so you can assume that the buffer is emptied by each "burst". Since the time until the next timeslice is fixed, and the baudrate of the port known, you can calculate how much data can at maximum accumulate in the buffer, until the CPU empties it again. It's a waste to allocate more memory to the buffer.

Say you got STinG's delay set to 50 ms, and your port uses 115200 bps (which is a fairly bad situation in terms of buffer size), then your port delivers data with 11520 bytes/s, multiplied with 50 ms gives 576 bytes. Only half a kilobyte is needed thus for the buffer. It's a good idea to give it some spare, so I'd set the buffers to a kilobyte.

The absolute maximum one can have with (quite foolish settings of) STinG, is setting the delay to 990 ms (i.e. STinG collecting data only once a second), while running the port at 230400 bps. This results in 23 kB accumulating until STinG empties the buffer again. One would choose 32 kB as buffer here, but as I said this is a bad mode of operation. Normally I'd never exceed 100 ms as the delay setting, even with slower ports. So even if you still use 230400 bps, when not exceeding 100 ms as the delay setting, you're well off when having the buffer sizes set to 4 kB.

So can you see now what an immense waste it is to set the buffer sizes to 64 kB ?

Cheers Peter

TOS 1.4. It's a huge improvement compared to the bug-ridden TOS 1.0 and 1.2.
Since you've got too little memory to run an alternate desktop, you might
want to install TOS 2.06, which has an improved desktop, but which requires
a little extra hardware to be installed in the machine.

IMHO you should use the money for that extra hardware for more memory instead,
and install TOS 1.4. You'll gain more from the memory than from TOS 2.06.

Ok, then it was little more than a misunderstanding.

> I was only suggesting that GEM readers should
> support lines with more than 80 columns, because standard or no standard,
> many messages DO contain lines exceeding 80 columns.

The question is, why do they ? Because there are clients that support this.

Why do web page authors use non-standard HTML elements that make the page
impossible to view with CAB ? Because there are browsers that support it
(Netscape and Internet Explorer).

My point is, if readers were more strict about this rule, pretty soon noone
would write such faulty messages anymore.

Falcon's can have SCSI problems but that may not be what's happening.
Have you tried defragging your SCSI drive or at least the partition
you're using to hold the image? Maybe it's spending too much time
boucking around trying to read the data.

c> I'm trying to find a nice, shareware ANSI terminal for my 1040 st.
c> Are there any out there floating on a web page or something? And what
c> is the name, so I know which one to grab.

The one I use the most is ANSITERM v1.90. However, as I don't have web access, I can't tell you where to find it. I got my off of a BBS.

It's better than Connect or TeddyTerm for ANSI BBSes as it runs in 16 colour mode, with half width characters giving an 80 column display. This is great for playing online games such as LORD and Planets TEOS etc.

Incidently there is another program out there, called Chickocom, which does the same job, but is faster at displaying than Ansiterm. Its up to v0.3 AFAIK. Its still being developed, so it doesn't yet do file transfers or has a dial directory, but I'm told that this is planned for later versions.

Cheers!

: connection ?"The Light of Adamas", der DRACONIS Web Browser
: found at http://www1.uni-bremen.de/~peter/clients.htm#ADAMAS

I don't have any special knowledge, but I have been visiting the web site periodically since mid-December. Both the TCP/IP stack and the Web Browser have gone through numerous and frequent revisions in that time, so it is definitely an active product.

I have downloaded two version of each in that time. Even the first version I tried was quite good. The TCP/IP stack worked for me first try, it only took about ten minutes to configure it (of course, I've had a bit of practice now, eh?). It is very similar to the system used by standard Windows 95, no scripting facility really, but you can have it open a VT52 term window to type your password and stuff in and then close the term window when the PPP starts.

The Web Browser is also very nice. No support for GDOS in the version I tried, so everything was scaled versions of the system font. It was very fast! In-line graphics are in there. I don't think I tested frames yet, nor do I remember whether it handled forms. One feature it has that neither of the other browsers I've tried for TOS have yet supported, was the ability to show visited links as a different color.

The later update I tried the stack had a few new features, but I couldn't get the browser to work at all. I went back to the older version of the browser and it worked with the newer version of the stack. I plan to visit again soon and see what progress has been made.

Hi there,

>Can someone direct me to the best website to get falcon information.
>Something that covers the basics and then more technical information.

Why don't you look at mine? ;)
http://come.to/claes.holmerup
You'll find info about the Falcon in a music studio environment, as well as hints about how to get the system to work as smootly as possible. You'll also find info about which harddisks you should use with Cubase Audio, as well as other useful stuff...

>After looking at a brochure, (I have 5 year old brochure still:-), I cannot
>see how you can hook up a standard ST colour or mono monitor to the falcon
>without changing the connector.

There are two adapters available - one for the old Atari monitors and one for SVGA.
I really wouldn't go for an old Atari monitor since SVGA monitors are of better quality (you'll get a better and more stable picture) and spare parts are much easier to find if they break down.

> I also don't see how it can be possible to hook up an SLM 804.

This one is simple: You can't connect an SLM printer to the Falcon.
When the Falcon was released, there was much talk about "soon to be released" interfaces, but they never made it to the market.

Best regards,
Claes

Not sure if there was. The version I have is v1.10, dated 1992 and converts
89a to 87a, splits an animated GIF, cleans one up (not sure what is meant
there) and can remove various control blocks from a GIF.

1903. Atari, ST Calc

Newsgroup: comp.sys.atari.st
Date: 1998-01-29 00:00:00 UTC
From: dave howell <dhowell@istar.ca>
Message-ID: <34CFE8F5.15F6@istar.ca>
Source record: 108916

A friend of mine living in a remote area has asked me to request assistance from any Atari owner. He wiped out the ST Calc disk and also the data disk he obtained from me when I sold him the system. His friend!! was looking at the disks on an IBM machine, saw the folders but couldn't open them so figured the disk was no good and reformatted them. Real smart! The only Atari dealer we had here closed so am having a problem getting either a copy or a new disk. Anyone out there can help?
Dave Howell. dhowell@istar.ca
Thanks for any assistance.

I've got the keyboard, power supply, floppy drive and the SSI game "President Elect" for sale, and I'll let it all go the the first person who offers $9 plus shipping for it. The video went bad on my 520ST, but I salvaged these parts in the hope that I could help someone out who has need for one or all of these parts.

Great, I haven't been to your site to get the latest update, I am still at
V1.08 so I was unaware of you including the control panel. Hopefully user
groups can make it clear that xcontrol is needed for STing. I don't know
where they got their STing 1.08 from, but at least users are getting it. Users
who don't have regular access to the internet, or know its workings. It is
all very new to them, as it still is to me:-).

>> Another user of course had HS modem all wrong when he copied it into the Auto
>> folder. Luckily this is what users groups are all about:-).
>This is a point where people err more often.

Yes it is.

> However, it's all in the HSMODEM
>.....
>the STinG docs.

Yes it is, and very clearly I might add.

Well sometimes it is illiteracy, and other times it is ignorance. There are
still ST users who are still not proficient with the workings of the ST.
Sometimes it is an honest mistake. Copy all files from a ram disk to the
auto folder, assuming that the order that they see them on the screen is the
order they will copy into the autofolder. The docs certainly aren't at fault
here. There are many that haven't used utilities like Autosort. THerefore a
user organises his autofolder correctly, then adds another program
to the autofolder, or deletes a file and now the order has been changed to
the detriment of all. Also some users don't have Auto folder manager programs.
These simple things, are what users groups are all about. How to read the
documents properly and how to install programs in the easiest manner.
I am just pointing out typical novice user problems.
Otherwise referred to as OPERATOR ERROR.
(Hard to believe there are still
novice users:-). Not a STing or HS modem problem.

>You can start the Dialer as an accessory too, which solves the problem on a
>different level. Needs a little more memory though.

How come I didn't know that? Well I am once again surprised.

>Well, for test purposes you really should use V1.12, since several PPP bugs
>have been ironed out meanwhile.

I only used V1.06 in October when I first got on. I moved to V1.08 following your comments that I should. It was well worth the move. I have since tested to other IPs with V1.08 doing nothing more than changing my dialer, name and password. Every week one of the STik, STing developers seems to release and upgrade. It becomes hard to keep up:-). I will get 1.12 .... I promise.

Bottom line is I want to help as many ST users get on the internet.

>Cheers Peter

Yes, Cheers indeed, keep up the good work.
Brian.

I do VERY MUCH. The FTP sites for the Atari TOS based computers is an
excellent source for software. I don't want them closed, I am on the Net
because of them. There is midi software on them too, I might add.

>
> I know that the STe has a Simms slot for memory expansion. The STf does not
>but there is a way to increase the Simms memory in the "f".

I know someone will answer you here, so I will pass for the moment.

> Let's all continue to promote
>this fabulous machine and keep it alive.

Umm, hello, thats the idea of keeping the FTP sites UP. There is more stuff
on them then I could ever use, but I use them because there is more stuff:-).
If you take away the Atari STuff from the internet, YOU KILL THE ATARI.

Next it will be comp.sys.atari.st (UNLIKELY:-) that will be eliminated.

>(They're a lot of them out there and
>can be had real cheap!)

That is my line of thinking. You can do it all with an ST.

The WINNER IS GUY HARRISON. A great big thanks go to the swampdog, whos
perfect description has allowed me to UNGZIP a file. YAHOO!!!
I will now be busy unzipping all these files that have been cluttering my
hardrive for 2 weeks. RIGHT ON. I am now command line friendly.

However, I must say that I cannot get this to work on my 520ST with 2.5
meg of ram and TOS 1.0. I am only having success with the STe? In fact it
worked the first time I tried on the STe, which is really puzzling me?
Perhaps it is the 520 that is having difficulty. I have noticed similar
resistance to other Command line programs. Any Ideas?

>
>On my STE three of the HAL files don't play at the right speed btw.

TOS 2.06 is the most advanced that will work in an ST, however, it's a bit
tricky to fit in pre-STE machine. Otherwise, you should be able to fit 1.4
quite easily.

This is in the Quick FAQ...

Cheers,
Nick

You need an adpter that allows you to hook up any of the ST monitors
to a Falcon, there's was also one made to hook up a VGA monitor to it too.
I run a SC1224 in true color ST mode myself. I'm not sure about the
Lazer printer, if I was to ever get one I'id put it on this TT.

If you look at the dates of the downloads you would see that it's
being constantly updated. Usually once every seconde day so it's
very alive indeed. It's also looking _very_ promising. This is
for the browser. For the PPP connection I don't know. All I
know is that it's a berkely compatibel socket and for now there
wont be any STiNG support as it needs a Berkely compliant socket
interface. As Peter is going to make STiBG Berkley compatible
at some point I guess it will work with STiNG in the future
as well.

Any way, the browser looks very interresting and the author will
look into Java script and Java VM later on and see if it's possible.

> sound, and the serial port handling.

Okey, that start to clear things up. Now I understand why Andreas says
what he does. But this does _not_ work on a Falcon. The Falcon was
not designed with Fast-RAM in mind and therefor it can't use Fast-RAM
for DMA transfers.

So for _Falcons_ with Fast-RAM and probably STs with FAst-RAM
(PAK030/FRAK)
the FRB buffer _must_ be used.

Still making the FRB buffer used by MagiC locateable would solve all
this
and it can't be such a big problem can it?

Hey! madmax@bfree.on.ca (Brian Van Tilborg) wasn't it 29 Jan 1998
05:37:43 GMT that you wrote:

>If you take away the Atari STuff from the internet, YOU KILL THE ATARI.

eeerm, I agree with your sentiments, However the above line is a
little far fetched don't you think ?, The only ftp site to stop
supporting ATARI is HENSA and although a great site, its never been
the same since Denesh left, its notoriously hard to log into, only
open certain hours, and for the last year most titles simply where not
there when you tried to download, There are a large number of ftp
sites that have the same software, I don't like to see hensa stop
supporting ATARI, But don't see it as the start of an epidemic in that
direction :)

Plus the majority of ATARI users in the UK..(Dunno about other
countries) are not on line, thus they would dissagree that anything
happening on the internet would "kill the ATARI"

Like I say, I agree with your sentiments, but lets get it in
prospective :)

There is a school of thought that ftp sites are harming the ATARI,
After all most people that go on line will stop using ATARI Public
Domain libraries, why pay when you can download?, These libraries have
served the ATARI community for many years through thick and thin, our
platform survives on PD, Freeware and Shareware, Yet the more people
that join the internet, the less people using PD Libraries and if you
get the majority or a large percent of ATARIans on line, then these PD
Libraries will fold,

Let us not forget the input these libraries have had, not least
Goodmans in the UK for the ATARI shows over the last couple of years,
how much software would there be on ftp sites if PD Libraries didnt
exist in the first place? blah blah blah....you get the general idea
yes :)

Sorry this is not a moan, just a few thoughts on another point of view
at 6am and bored silly :)))

Magnus Kollberg wrote:

> So maybe Uwe could explain how the data gets into Fast-RAM then?

This is easy: The SCSI hardware has direct access to Fast-RAM. The ACSI hardware has no direct access so the hard disk driver first loads blocks of data (usually 64 KByte) to a special buffer (_FRB) located in ST-RAM and then the processor copies these data to the final location. All hard disk drivers have to do it this way.

> Regarding HD-Driver. If you use the option in HD-Driver to use (or
> does it create it's own?) the FRB buffer, does HD-Driver use a FRB
> buffer

This XFRB option is only necessary for drivers that need an *additional* FRB. I don't know which drivers do, There are very very few if there are any at all.

> of it's own and the one in MagiC will be ignored, or will it use

No, HDDRIVER itself doesn't use this XFRB at all. It uses the standard FRB provided by the operation system, regardless if this is TOS or MagiC.

> If it does, how do you get the data from the DMA to Fast-RAM

See above. We shouldn't confuse ACSI and SCSI here. Both busses use DMA but devices connected to ACSI don't have access to TT-RAM. The ACSI bus is often referred to as DMA bus. I prefer the terms ACSI bus and SCSI bus because both do DMA.

> DAM to Fast-RAM and the only way I can come up with is to use
> ST-RAM as a buffer.

That's it, see above.

The TT's SCSI bus has no limitations. Devices connected to SCSI can
access the TT's complete memory directly. The TT is surely more
professional in this respect than the Falcon.
The TT has DMA sound.

> I know that HD-Driver has a opton for FRB. If this is enabled,
> does HD-Driver set up a buffer of it's own or? This is something

It sets up a new buffer called XFRB but this buffer is only use by
programs that know about it. These programs might be drivers for
streamers or so that need an additional buffer because the hard disk
driver will use the standard FRB. HDDRIVER will never use the XFRB, it
will only allocate memory for it. If you don't have software that
explicitly says it profits from the XFRB using HDDRIVER's XFRB option is
only a waste of memory (64 KByte).

> that we are having problems with on the AB040 under MagiC as

The standard FRB is used.

No. 57600 bps (= bit/s) divided by 10 bit/byte (8 bits plus start bit plus stop bit) is 5760 bytes/s, multiplied by 0.01 s (10 ms) is 58 bytes. So 128 bytes would be enough in your case.

> What about the send buffer? You said it can be smaller, but how small can
> you guy while maintaining maximum efficiency?

For maximum efficiency it should be the same size. The difference is that with a smaller send buffer, transmission slows down a bit, while a smaller receive buffer causes data loss (without handshaking), which of course is a lot worse.

> PR> So can you see now what an immense waste it is to set the buffer sizes

> "Delay" setting. What about serial programs or Fido front ends, such as
> Semper, that have no such setting. What kind of "Delay" could you expect
> them to use?

The figure always to use is the maximum amount of time the program spends "being lazy", i.e. not paying attention to the port. For STinG this is well-defined, as it works from interrupt. If the program has the option to set the time it relinquished control for cooperative multitasking, you can use that time, but only if no other programs run at the same time. If another program is running in parallel that "hogs" the CPU, this "latency" time can grow quite enormeously.

If for instance a badly programmed application does a lengthy calculation taking three seconds, and does no evnt_* calls inside the calculation code, you need to use those three seconds to be on the safe side, which of course will need a large buffer.

Fortunately there is handshaking preventing data loss. If the buffer get's filled up, the drivers assets some handshake line signaling to the other end to cease sending, until the buffer is emptied a bit. This means however the port is idle while the handshake signals are asserted, so efficiency is diminuished. But with handshake in place, you can choose a compromise between efficiency and smaller buffer size. Few reasonable programs will hog

the CPU for longer than, say, a fifth of a second. So those 200 ms is generally a good figure. In that case, there is a loss of efficiency only when such calculations happen hogging the CPU for longer than 200 ms.

This leads to buffers of half a kilobyte for 19200 bps, one kilobyte for 38400 bps, two kilobytes for 57600 bps and 76800 bps, and four kilobytes for 115200 bps.

Cheers Peter

>
> Bye
> Guentcho

Hi Guentcho,

I don't know the ST-Guide format (I hardly use my ST anymore) but there
is
a perl script texi2html which will convert texinfo documentation into
HTML.
Version 1.51 does a reasonably good job. I have used it many times on
my
OS/2 system where I have perl (and tex, groff, gcc, ...).

If you only have a few texinfo files and if you can find an HTML to
ST-Guide
conversion utility, I could probably transform those texinfo files into
HTML
for you.

Alternatively, you could look at installing perl on your own system. I
am
almost certain I have seen it available for the ST. However, you would
almost certainly need a hard drive for that, and probably a minix file
system which allows long file names.

1927. MidiMaze II Conversion Help

Newsgroup: comp.sys.atari.st
Date: 1998-01-30 00:00:00 UTC
From: parody@pconline.com
Message-ID: <MPG.f3c50b094200cfb989681@news.pconline.com>
Source record: 108740

Hopefully some of you either remember or still play MidiMaze II.

A long-term project of a friend of mine has been to find out how to make more mazes for MidiMaze II. Unfortunately, they're in an encoded format. He has worked for a few months, and eventually was sent a snippet of source code for MidiMaze II with the maze decoding routine. I have turned that into a pair of MS-DOS programs that can convert between MidiMaze, encoded MidiMaze II, and a decoded MidiMaze II format.

Unfortunately, until last week I haven't had a real ST to test with, and have only had PacifiST. With versions 0.46-0.48 of PacifiST, I have had no trouble playing MidiMaze II in single player mode, with the mazes created with the conversion utilities.

When I got the ST (as far as I can tell, it's a stock 1040STF), I used a program to make a disk image of one of the MidiMaze II disks we've used for years. Then I used PacifiST to add some maze files to that disk. I then booted off of the disk image in PacifiST, and everything worked great.

Unfortunately, when I use that program to write a new disk, bring it to the ST, and run MidiMaze off of it, MidiMaze triple-bombs after loading one of the newly converted mazes. It works fine with the original mazes, but anything my program has touched hoses it.

If anyone out there would have any insights on where the emulator and the real ST are separating, besides the transfer between PC and ST (which very well be, but I can find a terminal program and a null modem cable if that's what it takes.)

The current version of the MidiMaze Utilities is Beta 1.1; they are available at http://www.pconline.com/~parody/ Feel free to download and try it for yourself. If you do have any ideas, respond to this post or email me at parody@pconline.com

Thank you for your help! I hate being so close to having everything working. :(

This would probably be very good for those that run 68030 or better GEM environments such as TT/Falcon/Hades and MagicMac on 68030/040 Macintoshes. Remember they can easily join into the GEM fold now since Apple has written them off. If only MagicMac were advertised for these Mac users. A MagicMac/Netscape package on CD-ROM would be a nice system upgrade for 68040 Mac users.

PS: More 256 color, sampled sound, '030 or better games need to be made as well. How about a 68k support page that brings these computers together with shareware programs that can be run on all 68030 or greater GEM compatible systems. Maybe we need to move away from "Atari" and start to emphasize "GEM" since people are more apt to take Digital Research as more serious than Atari.

1942. Upgrading to TOS 2.06 & 1.44 Floppy

Newsgroup: comp.sys.atari.st
Date: 1998-01-30 00:00:00 UTC
From: David Cowderoy <david@nthfen.demon.co.uk>
Message-ID: <6auqf0$ip1$1@nthfen.demon.co.uk>
Source record: 108755

Any one know where in the UK I can get TOS 2.06, hardward TOS switcher and a
1.44 floppy upgrade kit.
I wonder if some one will make an upgrade for 120mb floppy drives.

Alfred Radauer (h9250467@idefix.wu-wien.ac.at) wrote:
:
: And being an ASH power user the prices go down considerably.

This is a sore point amongst international customers of ASH as we do not benefit from this Power User arrangement. To get Englsih language product we have to buy from someone supplied by System Solutiosn, and they do not have a Power user discount. To get the discount you must purchase from ASH, and they do not provide English language software.

As for the chart bugaboo. I think it is fine to use an external program for aestetic modifications of the charts, but if a spreadsheet program can't at least dispaly a chart to screen and print it, then I'll get a different program, thank you. Certainly they should carefully advertise this need wehn they discribe their product. Many programs require some form of GDOS in order to be able to print, or maybe in order to print charts, but they usually carefully mention this in the product description. It sounds, from the earlier post, that this was not the case with the Texel descriptions.

I'm aslo still confused, does Texel now finally really import and export Excel documents?

You can connect any SCSI Zip to the ST (including the Zip Plus), as long as
you have SCSI interface. As far as driver software goes, people generally
recommend HDDriver, which is commercial, but fully supports the extra Zip
drive features. You can probably get it from Systems Solutions in the UK.

Cheers,

Nick.

I'm not sure how the 68040TK handles the XFRB buffer. I know that it
takes care of the _FRB buffer (under TOS/MiNT but not under MagiC as the
cookie is not setup correctly and this is the root to the problem). For
the XFRB buffer I don't think the 68040TK does anything at all with it.
If you use the XFRB you should use DMASNOOP.PRG which will mark all
ST-RAM (including the XFRB buffer) to not cacheable. This will have the
side effect that all programs running i ST-RAM will be slower, but it
should make safe DMA/SCSI transfers with the XFRB buffer enabled with
HD-Driver and GEMAR. Have you tried it?

Maybe we should ask Doug to update the 68040TK to include handling of
the
XFRB buffer as well. For the _FRB buffer in MagiC it's up to Andreas to
include a corretly set _FRB cookie or we have to suffer from unreliable
or slow SCSI access on the AB040.

> that makes it virtually unprofitable.

Sure, but I get so tiered of people who does't care, or even try to do
something
about a problem. Sure it's a major work, but if a few people help each
others it can be done. I hate people who are "realistic" all the time.
Don't
people in here have dreams, visions? Are we all losers in a dead end
with
no turning back? I hate it. Fortunately there are a few believers left
who
belives that the Atari still can do a few things no one would think it
could
do a few years back and does something about it. I'm lucky enough to
know a
few of them. :-)

I would also say that I like what Uwe does for us, so it's not personal
even
if it might look like it. Sorry if I have made someone angry (I guess
that
wouldn't be that first time....).

> And there are other English solutions for repair and maintaining of disks
> (though I too would love an English DISKUS), so it's not like it's either

1950. Problem receiving fax in Junior Office with class 1 modem

Newsgroup: comp.sys.atari.st
Date: 1998-01-30 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <SYLUCCL@tos.pl.net>
Source record: 108793
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

You might remember my previous posts about Junior Office and faxes.
Although I said I had it working now, I have since realised that there's
still a problem.

The problem is that although faxes can be sent fine, they are not always
received properly. Sometimes the faxes come in without a problem, but
other times the page data is all sent but at the end, the sending station
reports "no response to EOP repeated 3 times" and the fax is not properly
received.

What does this mean, and what might be causing it?

This happens with almost all the fax machines/modems I've tried receiving
from, except one. That is the telephone company's fax testing service
where it will fax back any document sent to it. Faxes received from this
service always work fine. But I can't receive faxes from anywhere else.

I can't figure out what can be different about how Telecom sends the fax
compared to the other faxes that don't work.

Any ideas?

Yes, several, Parcp, HDD Daemon or Paralink 2000. They all require that you build a special cable.

Links can be found in the Quick FAQ.

Cheers,

Nick.

Xlink have released a demo version of their OmniNFS in the net.
It works for 30 days after installation.

Ther is also the Tropic NFS server (so the ST can read PC disks).

This is also available on the net, shareware, works for approx 2 hours so you can test out the NFS connection.

NFS between the ST & PC is great, especially if you have Minix on the ST, you can transfer files & preserve the file name (up to the limit you set in Minit).

> othertimes it detects the Link but displays the drive data with errors

I don't have a ZIP drive but the EZ-Flyer I do have is also supposed to set its own termination and, in my case, it does. However, the docs say that it doesn't always work and that you may have to terminate it separately. Another thought is whether you're plugging the ZIP into the chain with he right socket. I assume that, like the Flyer, the ZIP has two ports on the back? On the Flyer I have to use the A socket, from which I take it that if the adaptor detects anything in the B socket it by-passes its own termination.

Hope this helps,
Keith

Source record: 108801

Hello,

I've got copies of some texinfo files which I'd want to read on the Atari. I've heard that it is possible to convert such files with TeX, but i don't have TeX nor GhostScript installed. Also it would be better to read these documents as hypertexts. Is there a program to convert them to ST-Guide format? First i thought it wouldn't be difficult to write one myself, but I saw that the texinfo format isn't that simple. I didn't find any usable information in the News, maybe only something about Emacs, but I haven't even worked with Emacs. Is there a version for the ST under TOS/GEM, will the information remain a hypertext?

Bye
Guentcho

Hi,

I just wanted to let you know that I created a special WWW page about Atari 800XL emulators for Atari computers and clones. Besides that there's new PARCP 3.03, new MiNT 1.14.6 compiled for 68040 machines and other perhaps useful things to read and files to download.

My WWW pages were moved from Novell to Linux server, so they should work generally better now. They're also mirrored to two another servers, so you can choose the fastest URL...

THE ATARI ST QUICK FAQ - v2.3 / 1998-01-29

The 'Quick' FAQ was initially intended to be a small list of resources made to avoid comp.sys.atari.st newcomers asking the same questions over and over again. However, as the project progressed, and other members of the Atari community became involved, it simply became bigger and bigger. I doubt it really deserves to be called 'quick' any more, but hopefully it will still serve it's original purpose.

> WWW: http://cas3.zlin.vutbr.cz/~stehlik MiNTOS/Linux user
> mirror: http://users.zln.cz/~pstehlik Atari800 emulator

Where is the second mirror?

BTW, is there another source for the 800xl emulator on the ATARI falcon than
this or Dracos Page?
It is painfully slow.

BTW, the emuXL is at version 0.26 ATM.

Tschuess,
Frank

1963. "The StatiSTitian" reported strange values

Newsgroup: comp.sys.atari.st
Date: 1998-01-30 00:00:00 UTC
From: ut13@rz.uni-karlsruhe.de
Message-ID: <34d1491632c8904@rz.uni-karlsruhe.de>
Source record: 108806
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hello,

Hase anyone experience with STATS.PRG?

My former problems (2 and 3 bombs) were caused most probably not from a
hardware problem, but from a corrupt ".RSC" file (I don't know why it had
changed, but that's another problem). However, I looked what some
programs say and I noticed something strange: The StatiSTitian, V 1.0
shoows that information:

Total RAM: 2037760 bytes
Free RAM: 1451586 bytes (071.2%) of total RAM
Used TPA: 561086 bytes (027.5%)
System Area: 51712 bytes (002.5%)
Screen Area: -26624 bytes (0-1.3%)
^ (!)

There are also two pie charts:

The first is named "TPA Allocation" there I see:
pattern for "Free RAM" approx. 73%
pattern for "Used TPA" approx. 27%

The second one is named "Total Memory Allocation"
There I see only:

pattern for "Screen Area" approx. 2%
pattern for "System Area" approx. 98% (!)

Can anybody tell me what could be the source of
these strange numbers

Thanks
Guentcho

: too. But GS wouldn't even show the .PS files that came with the
: archives.

I am using GS 3.53 (Tim Gallivan's 1996 version). There are still problems with producing PS files on the Atari that can be converted to PDF. First you have to be careful of the font that is used (in other words, if one font doesn't work then try Helvetica to see if the font is the real problem).

Second, Acrobat 2.1 on the Mac never worked for me, so you have to use the PC version. I use a free service at "www.babinszki.com" (don't forget the "sz" in the name!). He has a registered version of Acrobat 2.1 and he converts (automatically) PS to PDF for free. Just takes a second. I have great success converting Pagestream PS files to PDF (single and multipage). Forget trying to use later versions of Acrobat with Pagestream PS files. Doesn't work! But, the good news is that later versions of Acrobat "read" 2.1 PDFs just fine. Means all of you with Pagesteam documents can produce PDF's (great news!).

The problem remains that GS 3.53 still cannot read a multiple page PDF document produced with version 2.1 of Acrobat. I know that this doesn't help much with trying to "read" PDF's on the Atari. Has anyone been successfull with multiple-paged documents?

I wasn't aware DISKUS was a backup utility. I don't know of a backup utility that supports long filenames. Optimizer does repairs and optimizations and it handles long filenames.

I'm using 57600 bps with a 10 ms delay. If I understand you correctly, that would be 5760 bytes per burst, requiring no more than a 6k or 7k buffer, no?

What about the send buffer? You said it can be smaller, but how small can you guy while maintaining maximum efficiency?

PR> So can you see now what an immense waste it is to set the buffer sizes
PR> to 64 kB ?

Absolutely. I really appreciate your detailed explanation.

I do have one followup question, though. It's easy to figure with STinG's "Delay" setting. What about serial programs or Fido front ends, such as Semper, that have no such setting. What kind of "Delay" could you expect them to use?

>TT/030 or Falcon030?
>--
>

Up until yesterday, I was using a NEC 3D multisynch with my Falcon 030 and it worked fine. It allows you to use both VGA and RGB programs with one monitor. To "fool" those pesky RGB programs (like older games and demos), you use an adaptor like the Multisynch Gizmo from Chro-Magic software.

Now, I've got an Electrohome GPM 1701 multisynch. Its 17" in size (!) and also scans down to RGB levels. It also remembers your most used scans and will automatically shift to them when you run a program. On screen controls, Energy saving, low radiation, .28 dot pitch, I'm in major-league love! :)

I got mine from Software Hut for $679.00... Yeah, I know-you can get 17" monitors these days for $400 and less, but they won't do RGB, and I refuse to give up some of those great Euro-demos like the Lost Blubb, Joint Venture, etc, etc,... <grin>

Hi Folks,
The subject says it all,
I'm loking for an ACSI to SCSI converter for a friend with an STFM.
I'd prefer a Link 2 or a Link96, though anything considered. I'm in Oxford.
We're also looking for another copy of Cubase, with manuals, version 2 or higher
for prefs, or else a copy of Breakthru (pref 2+), and a Replay 16 would be
useful too.
Also wanted, info on the CDP DATDAC or any other D2D related items..

> TT/030 or Falcon030?

I am currently using an NEC MultiSync 4FGe monitor connected to my TT030. The TT has a bit of a problem with SVGA in that it's screen resolutions are a little funny in size, which results in the famous "white border", especially in TT Medium.

I was using a Compac 15" flat screen which has digital controls, but I found that in order to get the height to width ratio correct, I wound up with a smaller screen occupying the middle of the monitor's screen (not unlike an unmodified ST and ST monitor), along with the (shorter vertically and wider horizontally) white border.

With the NEC, which also has digital controls, I am able to jockey the display to the right proportions, but occupying a much larger area on the monitor's screen, so I have moved the Compac over to my Macintosh, and am currently using the NEC with my TT.

I purchased mine at a used computer store for $299 CDN, so your price of $199 US (I assume you are in the US) sounds like about the same amount.

Ok, so the large buffer is not necessary. When I first asked the
question, I had noticed the speed bar (counter) in NEWSie stopped
during transfer when I was viewing pictures with Image Copy at the
same time (when the file selector came up). It apeared to me that recv
was stopped until I made a selection. Also during disk writes the
counter slowed drastically. I figured that a larger serial buffer
would allow more data to be retained until the file selection or
disk write was completed. After the file selector is closed, or disk write
completed, the NEWSie counter buzzes like I'm transfering data at
115K through the port.
So I guess that the transfer dosen't slow down from what you are

saying, but only the system display in NEWSie is delayed until it can be updated after the file selection is completed or the disk write completed. Make any sence (not technically, but what I am trying to say:)? This is all under MiNT. I usually am toying with a few other things at once while awaiting file transfers over the serial port.

Thanks,
Mike

It tells you how to do this in the 'read.me' file on the release disc.

Basically you just include the line:

SPOOLPATH = C:\GEMSYS\SPOOL\

(or whatever) in your NVDI.INF file.

>If it is, what hardware, software etc., do I need?

Yes. You need a host adapter to convert from Atari ACSI to SCSI - this plugs into the DMA port (Link 2 is the current one but you may find AdSCSI , Supra etc. cards second hand). You then need a SCSI HD (obviously), a source of power for it 5v and 12v, and some driver s/w. You can start with some PD drivers.

Often the host adapter, drive and PSU are sold together in a 'shoe-box'.

Wot!!! An EXE file is almost certainly uncompressed executable binary
for a PC.

I've had 'compatibility' problems ever since PPP was supported by STinG.
Today, with the latest binaries, I finally got past 'initialising link'
and everything seems to be running great.

Thank you, Peter.

Strange... my last post shows 'slip152.dsoe.com' as the NNTP posting host,
yet I was connected through PPP. During log-in, my ISP reports 'starting
PPP server mode', too (this displayed in STinG's dialer).

I have a selection of Atari ST titles for sale.

This List Dated 30/01/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
SCSI SC-ROM drive, Atari CD ROMS, 16-bit sampler cartridge/hardware.

All are on original media. I may be interested in part exchange/swap W.H.Y.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

>>>>>>>>>> All prices are in UK Pounds (sterling) <<<<<<<<<<
^^^

Prices DO NOT include postage.

GAME COMPILATIONS

Addicted to fun (nb,ni) 3
Bubble Bobble (1d,ss) & Rainbow Island 'Bubble Bobble II' (1d,ds)
Hollywood Collection (5d,ni) 4
Ghostbuster II, Indiana Jones and the Last Crusade & Robocop
TNT (4d) 5
Xybots, Toobin, APB, Dragon Spirit and Hard Drivin'
Finale (4d) 5
Paperboy, Overlander, Ghost'sn' Goblins and Space Harrier (20 levels)
Precious Metal (5d) 5
Arkanoid - Revenge of Doh, Captain Blood, Super Hang-On and Xenon.
The Dream Team (5d, ds) 5
The Simpsons - Bart v' The Space Mutants, WWF Wrestlemania and
Terminator II 'Judgement Day'

SPORT TYPE GAMES

You can use almost any external modem. Make sure you do not get a so-called
"Win-Modem" which need special drivers available only for Windows. If the
modem is said to be Hayes compatible or supporting the AT set of commands,
then it's ok.

Surf to my web page to download the software you need. URL in the footer.

Cheers Peter

[snip details of errors]

Did you try putting the Minis (when it was terminated) at the end of the
chain initially or do you not have the cables for it?
As the chain is, maybe you should check the dip switches on the Minis
and check that it is supplying TERMPOWER too.

1996. Re: 1. st>psion3 and softpc

Hi Jan.

The last version of s3-st is v 2.0 and you can find it on:

ftp.uni-paderborn.de/ftp/disk4/atari/tools/dfue/s3-st200.zip

or in its Uk mirror:

ftp.doc.ic.ac.uk/mirrors/ftp.uni-paderborn.de/atari/tools/dfue/s3-st200.zip

This program works great on the falcon. It is a GEM file manager,
backup and viewer, but does not translate the files when transferring
form/to the S3. This is not really necessary as the psion applications can
export files in standard formats as RTF, csv, etc. that are easily read
with Atari apps.

By the way, if you really need softPC, get the "bird of prey" CD,
as it is included on it. It works for me (DOS 3.3), but I have never
figured it out how to access the Hard drive from it.

Hope this helps.

Daniel.

Attention Atari Musicians!

Jamming on the 'Net

Tomorrows World on 21st Jan featured a software program for Jamming 'Live' on the Internet. As usual this is only available for PC /Mac. As the ATARI was (and most definately still is) THE musicians computer, why not write to these people and demand to know why there's no Atari version. I'm sure there's hundreds if not thousands of musicians out there in their home studios still using Ataris who'd love to have this software. If you're one then yet in touch with these people NOW!

Thank you for alerting me to the fact that Stik works with Mint even
though Sting doesn't.

I've got to exactly the same stage as you with Sting/Mint; I can
ping the servers but anything more complicated than that doesn't
work.

I'm quite happy for now to use Stik with Mint but I would like to go
back to Sting in the future (to use PPP)

Cheers! Simon:-)

Hi
O.K I believe the story so far is like this. The Oasis team have gone to PC
land & left us to struggle on our own, Not that they ever gave any support
in the first place. But as a Fan & regular user of Oasis may I make the
following sugestions. First there's nowt wrong with Oasis it works fine any
version, The problem has always been with the TCP/IP, ICE, Basically it's
crap
all those Checksum errors & it's inabillity to connect to a POP3 mailbox.

As you have STinG ppp working,Use it as your connection for Oasis instead of
ICE. Simple <g> Use Gary Priest's NEWSwatch & POPwatch, these allow you to
connect Oasis using STik or STinG & so far I have found it to be without
problem. If you have any dificulty mail me private & I'll try to help.

I have a successful Oasis/ppp connection on ZETNET using this setup, Which
has always proved immpossible using ICE.

Pete.

2004. Maseratinet

Newsgroup: comp.sys.atari.st
Date: 1998-01-31 00:00:00 UTC
From: shammond@loop.com
Message-ID: <6avniibkl1@usenet88.supernews.com>
Source record: 108695

I just wanted to thank all of you that tried connecting with maseratinet.com. The site is password protected (your E-mail address is the password) which is asked for the first time you access the site and the site is frame based. Using CAB 2.0 and the latest CAB.OVL I have had varying success getting to the different pages, but the results are never consistant. Those who tried connecting with the ASH stack could not get in at all - which kind of make sense as it currently (?) does not support passwords.

The site was constructed using a MAC and Adobe PageMill 2.1 and the server is on the MCI network. When access is denied (from my end) I just get a blank frame with the message that my browser has sent a command that was not "understood" :). I guess this particular site, or server, is not bilingual. At this point I cannot figure out if the problem is with CAB or the CAB.OVL. I guess I will just have to try it with NetScape and my PC at work to see if it works any better - which it most likely will. However this is not a sure thing as I have gotten sites in the past with CAB that caused NetScape to freeze.

Thanks again

Steve Hammond

They were just US distributors of the product.

To complete the information, the compiler originally belongs to a company
named Lattice Inc. and ran also on other platforms. I think that HiSoft probably
owns only the Atari-specific part of the package.

If you have a mono-monitor and colour monitor/TV - you NEED one of these. Plug both monitors into the switchbox and the switchbox into your ST's monitor port, then flick the switch to change from one to the other.

Yours for £9 including p&p.

Mail me to secure.

Cheers

Martin

mwaterhouse@cix.co.uk

2008. FS(UK) Trust ST Hi-Res Monitor

Newsgroup: comp.sys.atari.st
Date: 1998-01-31 00:00:00 UTC
From: mwaterhouse@cix.compulink.co.uk
Message-ID: <Ennu56.BJz@cix.compulink.co.uk>
Source record: 108699

TRUST MM-100 Mono Monitor (ST Hi-res)

** May Be Faulty **

Mono-monitor, served me well for 2 years (very sharp picture),
very compact, much nicer looking than a SM124/5. Tilt & swivel
stand. Comes with an ST lead with a built in speaker.

The Problem:

Developed a flicker at the same time my 7 year old STe popped
it's power supply - could be co-incidence?

After the £50 ST power supply repair, and given that I will be
moving to a PC shortly I don't want to risk damaging & losing the
ST in the meantime, so the monitor hasn't even been tested since
my ST was repaired - it may even work fine!?!?

I also don't feel it's worth me paying for any possible repair
for the short time I'd be using it.

Hence..... I'm only asking for £15 *including* delivery.
Bargain for a competent techie. Otherwise expect to have it
repaired, just in case!

Cheers

Martin

In th UK, look for The Upgrade Shop (01625 503448). They should have all
that.

There's no upgrade for LS120 drives at the moment, but you can use a SCSI
ZIP, so why bother ?

Sometimes .exe compressed files are just .zip files with a little bit of
autodecompress code. If that's the case, just rename them to .zip and
decompress them with STZip or whaetever you're using. I did encounter an
.lzh file once on a PC too.

Cheers,
Nick

I gave up using the ICE part of Oasis2 last year and it was the best
decision I made for a while. And I continue to kick myself for not
making the change earlier.
I now use Sting with Gary Priest's POPwatch and NEWSwatch. They
collect mail and news which Oasis2 can read.

Gary Priest's software can be found on his website at
http://www.the-gap.demon.co.uk

Rich.

FIRST THE SOFTWARE:

1. TRUEPAINT V 1.02 $15 Excellent drawing program; all resolutions and colors. Works in ALL
ataris. From B\W. to true color. Manual available.

2. ICD hard disk utilities Version: 6.2.3 2 disks no manual $10. I will send a list of the files upon request.

3. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations audio-video; Also watch
kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol CD-ROM $15 (Falcon).
Needs Multitos.

HARDWARE

1.ST 1040F 1MB ram. This machine has an audio output jack (RCA female) so you
can plug in to your external ampolifier. No need for pre-amp. It will go with
hayes modem/cable and the famous beetle mouse!. $50

2. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari or pc. $30.
(has original PC software)

3.Atari PS for external Disk Drive $8

4.external PS for the 520ST $7.00

5. SC 1224 color monitor. It needs video cable; works fine. $16

---------- NOT ATARI----------
1. SM 57 Shure microphone $ 70. (cable+ desk stand included)
2. Akai Open reel tape, Hi Q sounds, head ok. 4ch. $ 50
3. Tascam 4ch mixer(line in/mic/attenuator) +tape recorder/dolby. $30

Free stuff (with the buying of any of the items :) :

Free manuals:
HD Driver 4 rev 1.1 1/96
Deskjet utilities pack v 1.2
Calendar and appointments
Atari falcon AFM; D2D; SAM.
Imagecopy 2
Pagestream 2 quick start manual

- Omnires Monitor emulator for the ST.
-External floppy drive 1DD good case/mechanism.

If interested send ZIP code to ask UPS for charges.. For software, I can send it for $3.00 US priority mail. (if you are in the US; I am willing to send abroad also) Regards, Phil.

There's nothing peculiar about this, Pavle. Many ISPs work with
dynamic IP addresses and STiNG can handle this. The fact that you see
different addresses means that STiNG IS receiving from your provider.

There must be something else going wrong.

Ok. My 1040STF's power suply has gone for good. So I'm willing to replace it with one standard PC Power suply. Anyway, I want to seize the opportunity and give my ST a new housing (one PC standard tower). Any one has done this? Any comments will be appreciated. Think its not such a difficult task... My main concern is (you guessed) the keyboard.

Thanks in advance...

ohcan

Quite some time ago. But as Craig did this at work he can't release it.

The jack on the back of the STfm is for video out, as to a VCR, etc. It plugs to one of those tv/video game switching devices, then on to the tv or VCR on a coax cable as channel 3 or 4. The resultant signal is low-quality, but can be used for video titling, etc, with something such as Cyber Paint.

I'll give a bit more detail to this. For some reason while using different clients under Magic I quite often have a crash, usually a couple of bombs and the error -69. Once I get one of these I can't use any other client until I've done a reboot.

Since I've found it quicker for me to get restarted, I save the port setup with modem 1 active once I connect. Then, when I have to reboot STing is aready active once I get back to Magxdesk. Then it's just a case of starting up whatever clients were being used and carrying on from where I left off.

Once I've done whatever I was doing while connected, I disconnect and save the port setup again with the modem no longer active.

> So have the port inactive by default, and your comms problems will be gone.

Usually it is, unless I'm actually connected.

> > so before I use it I have to boot under TOS. To this end I have a Kobold
> > job that renames the XCONTROL.ACC, STING.PRG and MAGXBOOT.PRG. Then I
>
> All obsolete if you handle STinG properly.

It may be obsolete but it works for me. And since I don't need STing or the control panel while using the comms prog, they free up some memory. Not a great deal, but 200Kb free is 200Kb more available for me to use.

Hsmodem works great for what it was designed to do, but it is
unsupported and the source code is unavailable. In the context
of trying to foster a new generation of Atari programmers, I
would characterize it as rather useless.

Hsmodem also doesn't work 100% with MiNT. There has been an
attempt to correct this, but the author of hsmodem was
unsupportive.

FWIW I think we could do with public sources for a decent serial
driver.

Dunno what sort of file selector you use. I believe the only non-modal
one for MiNT is Freedom, if you do not use that one, then obviously the
screen is frozen as long as the file selector is shown. So obviously the
speed bar stops. However, since MiNT multitasks preemptively, this does
not necessarily mean that NEWSie stopped downloading. This depends on how
NEWSie does things internally.

If NEWSie does stop downloading, then there is virtually nothing you can
do about it. Enlarging the HSMODEM buffers is useless, the larger buffers
are not used since TCP does it's own flow-control. This means transmission
stops as long as NEWSie doesn't collect the data. The only thing that can
relieve this a little is enlarging the TCP receive window. This works even
if the HSMODEM buffers are not enlarged at all. You might need to allocate
more internal memory in that case though (ALLOCMEM in DEFAULT.CFG).

> disk write was completed. After the file selector is closed, or disk write
> completed, the NEWSie counter buzzes like I'm transfering data at
> 115K through the port.

This tells you that the serial buffers are not involved, as this would
happen even with tiny buffers.

> So I guess that the transfer dosen't slow down from what you are
> saying, but only the system display in NEWSie is delayed until it can
> be updated after the file selection is completed or the disk write

No, in that case the bar would "jump" to the new setting, instead of
smoothly moving there. I guess it really means NEWSie stops downloading,
but collects all the data that is already in the machine, but hold by TCP,

at a maximum rate.

Cheers Peter

This can only be solved by your ISP.

I guess what happened is that they used SLIP (only ?) earlier on, then allowed
PPP too, but did not bother to adjust the DNS records. So what it should read
probably is "modem152.dsoe.com". But this does no harm whatsoever.

2042. STiNG, CAB, and Multitasking

Newsgroup: comp.sys.atari.st
Date: 1998-01-31 00:00:00 UTC
From: szhays@dilbert.ucdavis.edu
Message-ID: <6b00go$7bk$1@mark.ucdavis.edu>
Source record: 108733

STiNG and CAB together do a reasonable job of multitasking on my computer, which is running Geneva so depends on the cooperation of the running applications for multitasking. There is only one point in any web surf session that I have a frustrating lack of control over my system, and that is during the "resolving host" and "connecting to host" stages. Why do these periods take over the system?

This is particularly frustrating because the built-in countdown periods for these operations are so high. If I mistakenly type in the wrong URL, I have to wait twiddling my fingers for probably half a minute or more. Because of the lack of multi-tasking at this one particular point, pressing the escape key does no good and I can't click on the "stop" button in CAB.

While I'm on the subject of countdown periods, who the heck is ever going to wait 120 seconds for a sluggish server on the other side of the world to send a byte or two to keep a connection open? I've never seen this countdown go below 100 and then actually apy off with a response. Usually, if it takes 20 seconds or more, your are better off [esc]aping and trying the link again. Maybe this is just my imagination. Anyway, this is a CAB.OVL setting, I think, whereas the complaint above I think is a STiNG thing.

I don't want to sound too crabby here. I love all the above mentioned products. These are just minor tweaks I was curious about.

2043. Re: TT hardware questions

Newsgroup: comp.sys.atari.st
Date: 1998-01-31 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <6WMUCPJ@tos.pl.net>
Source record: 108758

Julian Coleman (J.D.Coleman@ncl.ac.uk) wrote:
: I'm after a few hardware recommendations for my TT. The first is a new
: disk. I think my existing DEC 1Gb is going to die soon (it's making loud
: squealing noises - I presume the bearings are going), so I'm looking for
: an internal boot disk (2Gb or larger). Does anyone have any particular
: recommendations?

Any SCSI disc should be suitable.

: The second is memory - I currently have a Systems Solution expansion board
: with 20Mb installed (4 x 4Mb*9 80ns, 4 x 1Mb*8 70ns). When running NetBSD,
: it falls over with MMU faults. I think this is a memory problem, but I'm
: not sure if it's the expansion board or the memory. Shuold I go out and
: get an aixTT board?

I don't know whether that is your problem or not, but I do have a AixTT
board and it works nicely here. It's much faster than the Atari RAM board
that I used before.

: The third is typing problems. If I type quickly enough, I can be pressing
: one key while still releasing the previous. If I have the left shift key
: pressed, and one key is 's' and the other 'w', 'e', 'd' or 'x', I end up
: with the equivalent of <shift><F1> being pressed. This is very annoying -
: I end up typing 'NetBS^[~10D' :-(I tried using a Mega ST keyboard instead
: of the TT one, but that made no difference. Also, it's not software - it's
: the same with/without auto folder/accessories, etc. Can anyone else
: reproduce this, or is it just my machine?

This is a well-known problem with, IIRC, all the Atari machines. I guess
it's a bug in the keyboard. There is a software patch for it that works
under TOS, but I don't know about NetBSD.

I believe the source code for the keyboard was given in the Abacus ST
Internals book, so I suppose someone could fix the bug and burn this
fixed version into a new keyboard processor. Alternatively you could try
getting one the of the AT keyboard interfaces, since these probably don't
have this bug.

: Could you tell us once again which version of JuniorOffice you use and on what
: kind of hardware (Falcon, ST, TT, Clone, Emulator) and OS (Geneva, TOS, MagiC,
: N.AES).

It's being used on an Atari STE with 4MB RAM, TOS 1.06 or 1.62 (I don't know which) and a 14.4K fax/data modem. I believe it was also tried on a C-LAB Falcon MK-X with 14MB RAM, on the modem2 port, under TOS 4.04.

It's Junior Office 3.04 English version. However, since the supplied fax driver would not receive faces properly, someone sent me a different driver that does work (I believe it came from the German version 2.x or something). I thought all was ok, but now this problem has turned up...

(It's not me who is using the software, so I can't give you any more details...)

: found at
: http://www1.uni-bremen.de/~peter/clients.htm#ADAMAS

: Any info?..Live dead, looking good or ??

Last time I saw it it was being regularly updated and looked promising.
The design of the GUI was not very nice, but it did a good job of the
displaying the pages and worked well considering its early stage of
development.

Strange that the developers of such internet software are never seen on
the usenet...

The one thing that makes this browser useless, at least for me, is that it
requires yet another TCP/IP implementation that is different from all the
other ones. How many do we have now, STinG, MiNTNet, STiK, PPP Connect,
Wensuite, and now this! If they upgrade this browser to support MiNTNet
then I would definitely use it, but otherwise I'm still stuck with CAB,
which is getting more bulky and slow all the time...

Ok, in that case, what I'll do is buy a SCSI terminator and stick that
in the Zip's second port. I was holding off 'cos they're about 20
quid apiece - let's just hope it works..!

Keith also wrote:

> Another thought is whether you're plugging the ZIP into the chain with

> by-passes its own termination.

Yes, the Zip+ has two sockets, one labelled "Autodetect" and another.
You _have_ to use the autodetect port because otherwise the Zip+
doesn't know whether it's connected to a parallel or SCSI link.
Furthermore, you also have to use the autodetect cable that comes with
the Zip+ as it uses redundant pins in the cable to make the
distinction between SCSI and parallel communication.

>as others should testify.......

That's due to it being Basic, and a lot of people don't think Basic has the ability to do certain things. They just have to try it, which is usually all it takes.

What we can use are some documentation and source code samples, like what they have with other platforms, like Unix and Gnus. What is out there right now is just about broke up all over the place, and that makes it harder to find it. Maybe UMich could do something like this, as well as mirrors in other countries. Once that's done, a CD ROM could be burnt, thus helping even more.

>I could take a complete beginer, someone who has never programmed
>before, cut out all the trial and error and pass on the end results in
>a rediculously short period, a complete novice could make the above
>mentioned game in 3 months, anyone who knwos how to use Variables and
>has an understanding of an ATARI screen layout ..half that,

That's just it. Those who haven't really done much programming on the STs, are sometimes having problems due to insufficient documentation on certain areas that they want to program on. There's plenty of books out there on C programming, but just about all of them are for IBM-based stuff. Now, like I said, putting together documentation and source code in some sort of archive can work to an extent.

>Unfortunalty theres a LOT of biased people out there who wont even
>download and try a game simply because of the word STOS, they all
>believe its still in the past :(No matter how I try I cannot get them
>to realise what it can do.....

After seeing Heartland, I must say I'm impressed, after playing with that game for awhile. What can it not do? Seems it's unlimited only by your imagination. How about modem/serial port access?

>So anyway :) I honestly wouldnt have the incentive to do the above for
>one or two people, but if I could get ten people who are determined to
>make a quality game and dont have a pre defined bias towards STOS and

>do have a couple of months then I would do it en bloc

What incentive do you need for just placing it on the internet on a webpage, and allowing everyone to access it? That's more than enough, as you got a whole lotta lurkers who will just rather surf than post. How about other things than games? I'm sure it'll do nicely.

We're talking educational stuff, something that'll challenge your brain cells, as well as allow you to learn.

>"Zip Woes".....

Ben,

Try plugging the Zip into the LinK and your external HD into the Zip. Termination power on a SCSI change can be a very tricky thing and it may be that your external HD has just enought internal resistance, even though the termination resistor(s) have been removed, to cause a problem.

EXE is normally an [Executable] file. You may need to change the extention to PRG or TOS or TTP to get them to run. They could also be compressed executable files (these usually have the decompressor built into the file and run just like a regular file. Possibly the EXE is for TOS 2.xx or MultiTOS, I am not sure.

On very very rare occasions my tos 1.2 STFM would do this with 3 keys
in "action" at once. For no reason I can explain I came to the
conclusion it was the keyboard processor not being able to deal with 3
key rollover.

I'm not sure but I think there are different criteria. comp.sys.* is
some sort of priviliged hierarchy iirc. The group might still be
active.

>To post in them the message had to be approved by the
>moderator and there isn't one, so they just disappear into oblivion.

I forget the name of the moderator but this is what happened:

Some of us tried to post to the group but nothing appeared.
[time passed]
Moderator posts saying the group is going to be closed - does anybody
object
[no time passed]
Lot's objected.
Lot's emailed.
[time passed with no response from moderator]
Group shut down.

The intention was to shut the group down well in advance of saying so. This is patently obvious simply because nothing appeared there for substantial periods before his announcement. Why the moderator failed to do any moderating is anybody's guess. We shall never know.

Having failed to do his job he ignored all protests when he did post, and by doing so, took away all chances of anyone else becoming the moderator - and there were offers. Suggestions that the group be made unmoderated also fell on deaf ears (obviously).

>This must have happened since January 1995 as that's when I first got
>on the net and I remember the closure notices some time afterwards.
>There was an attempt within the last 18 months or so to set up a new
>unmoderated binaries group in the alt hierarchy but I think this died
>the death as most providers didn't carry it.

It would require a usenet guru to ascertain the true status of the group. If it were found to be active then the simplest course of action would be to remove the moderation.

>If I can log on and send this message, it'll be without any CPXs!!!

A shot in the dark ...

Possibly a corrupt sector or file on the hard disk? Try checking this
and partition info else:

If you've got them loading from a folder then try renamimg the folder
to something else. Leave the stuff in there then create a new folder
with the original name. Install all the buggy stuff again from
backups, one at a time.

If they are in the root directory then just rename them all to
something else and copy from from backups.

Check for a virus - unlikely.

Check the hard disk driver, most especially if it does posess
"accessory" loading from a defined folder. It might be corrupted. Try
booting the driver off of a floppy. Otherwise again, rename it and
anything else associated with it, to something else. Install again.

It might be nothing more sinister than hard disk fragmentation. If you haven't got a defrag utility then move everything off the scsi onto the ide so that the scsi is empty - no files, no folders - nothing.

All you have to do now is move all of it back onto the scsi. If the scsi has more than one partition then it is sufficient to move everything off the "erroneous" partition onto another partiton and back again.

I know of a used computer store that has a bunch of NEC Multi-sync
monitors for $199 each, can these monitors be used with eather the
TT/030 or Falcon030?

Yep, you can. Watch out for the right videoadaptor!
You need a Falcon -> VGA-Adaptor for any (NEC) VGA-multi-sync

If you made your own adptor, watch out for the right
connection of M0 and M1 signals!!!

Nothing except what the homepage says.

> Any info?..Live dead, looking good or ??

It's alive, the latest version I tried was dated 25/1 or 27/1 :-) It looks awful though, the GUI is just horrible. About the ugliest thing I've ever seen.

However, it rendered HTML pretty fast, if they can speed up image-loading a bit it could be good. The pictures were screwed up on my graphics-card though.

The big downside is that it requires it's own TCP/IP-stack :-(Why? WHY?? The last thing we need now is more fragmentation in this area. The Amiga has several stacks but only one API, thus all internet--software works regardless of what stack you choose.

The situation now is not acceptable. If you want to use the ASH emailer you need to run PPP-Connect, but then you're limited to ASH's expencive apps for everything else as well. Unless you use STinG or MiNTnet that is, but then you'll have to disconnect and connect again just to use another client...

Does anyone know what is happening with developemnt of OASIS ?

I am still using version 2, which works very well, but still with a slip
connection, the ppp with this version I believe is problematic.

It's just that I haven't seen a thread for ages about OASIS, still with Newsie,
CAB and ATARIRC, full internet access is provided via Sting, which works
very well and provides ppp conection.

Source record: 108783

Hi!

I can't send with emailer anymore. What I did? Don't know, but I know that my provider did something the same day. I can receive mail and news but when Emailer try to connect with a SMTP-server the mails won't leave my computer. After some seconds I receive these messages:
"Network Error: Netzwerk wird abgebaut and "Network error: Connection Timeout".

I don't know if this have something to do with my previous provider, but it does not work with Telenordia/Algonet either, one of three largest providers in Sweden.

I know that my previous provider, Tripnet started to use a software firewall called Exim to stop school students and others to send SPAM through their SMTP-servers, the same day.
The strange thing is that MyMail and NEWSie works just fine with no problems.

If, so... then it seems that Emailer won't work in Sweden anymore. There must be someone who have the same problems with Emailer.

My version of Emailer is 1.0 dated 1997 Dec 14. I know that there's a version 1.0 dated 1997 Dec 22 but I can't get it.

Last time I checked the Oasis home page it had reverted to being mainly a personal page for Phil Yeadon. There is information still in a sub-page: PY has bought a PC and is developing Oasis 3 for Win95. All the archives etc for Oasis 2 had been removed, with links to the Nest pages for support and directions to Demon's FTP server for the files. Looks like it's dead as the proverbial dodo.

It did have something of a bad reputation in the end due to bugs/instability/high cost/poor support judging from posts in here. I myself never managed to get it to work at all, even the offline part was hopelessly buggy IMHO (on my system at least). Definitely not worth registering for me. Shame really, as Oasis 1 was promising and I used it from 1995 when it was launched until a few weeks ago, despite its limitations (eg having to revert to 1.33 from 1.35 to get a working address book under MagiC, the broken newsreader which ignored threading and broke threads for everyone else, no built-in encoding/decoding of binaries etc).

If you want PPP you can use POPwatch/NEWSwatch/STinG with Oasis 2 and ditch ICE which seemed to be a major problem in itself. Another viable alternative is POPwatch/NEWSwatch/STinG/Okami, which I recently switched to from Oasis 1. Newsie is also viable and has many users in here, though I prefer Okami for offline use.

I'm tempted to say you don't need one but I can't in all honesty recommend it long term. Yes, you can learn C with 1 meg and a couple of floppies. This is exactly how I started and learnt much. Putting it into practice was the problem. Floppies are dog slow and unreliable when a compiler is trashing the heads about with all its temporary files and using a ramdisk will guarantee the program crashes losing the source!

This isn't a major problem until you have learnt enough to be writing full programs though. ;-)

Hi Simon,

Hey, what are friends for?:) Yep, STinG *almost* works with MultiTOS/MiNT.
It would be nice to get ppp going as it is a better TCP/IP stack. I do
believe if I understood all the conf's of MiNT1.14.6 I could get it working.
Maybe a work around the bus error. I'm not sure if it's the Dialer or the
STinG.prg/stx's itself, that's the sticking point. I assume it's the way the
TCP stuff is being handled by the serial port that conflicts with MultiTOS
or vise' versa. I really don't know enough to make a suggestion as all my
efforts have been by trial and error. I have no way of debugging it ;)
Close, but no Cigar!

Hallvard.

I really appreciate your effort updating and posting the FTP site
list. Your list is a very useful reference to look for software in the
INTERNET, and this is specially true for newcomers. Maybe you can post it
just when there are changes, but in that case it would be good if it's a
reference to it in the FAQs.

: Here's the February 1998 update of the FTP site list.
: No changes so far, even though Hensa in the UK have announced that their
: site will be closed down. But for the moment it's still running and having
: checked it a few moments ago the Atari software is still there.
: Perhaps this will change soon, but until then the list stays unchanged.

: By the way... is there any use for my FTP site list any longer? Does anyone
: use it at all or are my updates and postings just a waste?
: I'm wondering since virtually nobody responds or comments the list any
: longer, so this might mean one of two things:

: 1) the list is needed by the Atari community, but everything looks fine,
: the links work OK and the list is useful, so there's no need to comment
: anything.

: 2) nobody uses it any longer...

: I'd like to hear if you all need continued support for this list, if I only
: need to post new lists when there are changes (instead of regularly once a
: month like I've been doing for a while now) or leave the list like it is..
: What do you think? I have no idea what the Atari public thinks about the
: list so I need to ask :-)

: Anyway, here's this month's list, with no changes since last month's.
: Enjoy!

: Hallvard

Regards.

Daniel.

>properly.

I DID know that. It was just a side note (observation or experience).

>> use it :) An alternative is the new CRAP protocol <g>.

>Are you after a second mention of you in the HYP ? Maybe for repeating old
>jokes ;-)

Yo Peter, don't you know, no one reads FAQ's, esp. HYP(e)'s. Here's an old
joke, "Take my wife (pause), please!" or "I just flew in from New York, boy
are my arms tired". Are there standup comedians in Germany, China, Hong Kong,
Sweden, Norway, Poland, Scotland, Botswana or Tasmania? If they did their
routine, would all understand the translation? I'm not a comedian, but some
of my co-workers think so ;) I like to mimick peoples gestures and speech;
It's got me trouble more than once. Do I care? No. One of my many faults.

>> Subnet mask isn't needed as STinG "automagically" negotiates routing.

>The reasoning is not quite correct. Subnet masks aren't needed for modem
>connections, as they are point-to-point type connections.

Well, most ISP's include the Subnet mask in their setup info. I wonder if
they think their customers don't use modems.

>Anybody who still has problems, should get a new MODULE.LZH from my web page
>in a couple of days, in which I fixed another bad bug that prevented logins.
>The bugfix is in beta test now and will hopefully go out Thursday or Friday.

Your right. It worked. Ahh, I just saw this "old" post, so this reply is a bit "tongue in cheek". I am fascinated by posts here on c.s.a.st as it is an International Community. Most posts are very straight foward, but attempts at humor or satire are very different in different countries. Thus, sometimes people don't laugh or smile. I'm just glad we all try to communicate. If I post something that's ambiguous, wrong or offensive, please let me know. It won't hurt my feelings one bit. I'll certainly let anyone know what I think (factual, satirical, or whimsical).

2083. STinG and callback

Newsgroup: comp.sys.atari.st
Date: 1998-02-01 00:00:00 UTC
From: Robert Fenyo <robi@ovlev1.mdche.u-szeged.hu>
Message-ID: <Pine.OSF.3.95.980201095130.25497A-100000@ovlev1.mdche.u-szeged.hu>
Source record: 108598

Hi Atarians,

I've got a 1040STe and STinG 1.12 at home, and a DEC Alpha with 'mgetty & callback' package installed at our department. I'd like to make a callback to my STe from the Alpha. Since I haven't too much experience with STinG yet, I wonder if there is anybody out there who has tried to setup a callback procedure and how to setup the appropriate script on Atari.
The server-side configuration seems to be OK, 'cos I've tried callback with PC's and it was working.
Briefly the server does the following things:
- requires a certain login name and pwd
- after logging in it requires my home phone number
- disconnecting
- rings me back at home after a few seconds
- requires to log in as user 'ppp'
and that's all.
Thx for your help in advance;
Rob

I have had the last two version of STiNG working under MiNT and NAES
just fine with PPP. I wonder what the problem is. I can send my MiNT cnf files
and STiNG related files if you wish.

Hi Chris

I have *just* sold my Link... but I have an older ACSI-SCSI converter,
as used in the older Mega STs - a BMS-100 board, which you will need
to place inside a shoebox size case along with the hard drive, or in a
tower case or similar. This has an on board clock too - which is very
useful for STs withough the cart clock.

Send me your offer, if interested.

Message-ID: <WS.34d44efe.000187c5.oxo@imaginet.fr>
Source record: 108602
Body handling: HTML body converted to readable text

```
The new version of Wen.Suite is now available: 2.40b.

The registered users should contact us to get an english update.
The demo version is available at:
http://wwwusers.imaginet.fr/~oxo/

The modifications since v2.40a are:
-More &xxx; HTML escape character codes added
-The tag has been added (indentical to tag)
-Better handling of the editable fields in the windials & indexed dialogs
-The Newsgroups list can now be retreived again (with a warning)
-The Newsgroups list correcty updates the news window after retreiving
-The black square in the top left of the selected mono icons has been removed
-Correction of a formatting bug present if a form object is alone in a table cell
-Support of the not closed comments (due to a bug of the NetScape HTML editor)
-Better tag handling
-The spaces after a tag are now preserved
-The HTTP Accept field has been added, necessary for some servers
-No more disconnection during a HTML form edition
-More than one HTML form in a page is now permitted

Enjoy!

This is the case for me. I use it quite often when hunting for
software. If you can keep up the monthly posting I'm sure it's useful
for newbies who haven't got themselves fully sorted for web access
etc. This gives them a clue as to where to go to get themselves a full
set of net programs for a start. As you don't find Atari programs
everywhere using your list can cut out a *lot* of frustrating and
fruitless searching.

Keep up the good work!

John

2096. Help: TT030 and Internal HD

Newsgroup: comp.sys.atari.st
Date: 1998-02-01 00:00:00 UTC
From: schrist@interlog.com
Message-ID: <6b1853$9f9@shell1.interlog.com>
Source record: 108611

Next question...

I have a TT030 (with CaTTamaran) 16M TT RAM, 2M ST RAM
TOS chip set (TOS C301927-005)

I have an original 50M internal which works fine.

I recently purchased a Seagate ST32430N - Hawk, 2G

I want to replace my current (50M) HD with the new 2G HD. When I disconnect the current internal and connect the 2G and boot. All seems fine. I boot of a floopy with ADHI 6.061 which reports the drive as SCSI 0 - ST32430N. So all looks good.

However when I run HDX (5.04 - if I remember correctly). The program loads. So I choose format the drive light continously flashes (upto this point it flashes as expected - whenever accessed like when ADHI checks). On the screen it says it's checking for devices. My machine isn't locked up because I can move the mouse (a busy bee at this point. However, it never gets to the point where I can select the device to format (after hours!!).

If I run the same program with my old internal I can go threw the same process but the device list comes up.

WHY!?!?!?!

Currently the jumpers are set as:

SCSI - 0
Enable Terminator - on
Parity Option - on
Terminator Power from Drive

This the defaut setting. I tried setting Parity Option to off, but it made no difference.

Since I had no idea what Terminator Power from meant I tried the 3 other settings:

Terminator Power to SCSI Bus and
Terminator Power from SCSI Bus.

I've played around with various terminator Powers and Parity options. Rebooting after each. However, without any luck.

None of the pins are bent. I've also made sure pin one on the mother board connects to pin one on the HD. I've even tried 2 different ribbon cables... Both of which work fine with the current internal. I only get a

problem with the new SCSI device.

Anyone have any sort of suggestion?

The fact the light keeps flashing when scanning for the devices to me,
indicates it see the device. However, it's as if the device doesn't
repsond "correctly" back. So it requires the device for ever and ever
(I've let this run well over 4 hours).

The new HD is SCSI 2 fast but is SCSI compatible.

HELP! Please. I've already had to return a previous 2G HD as it was just
pain dead... (It didn't respond at all).

What am I missing?

2098. Some 520ST questions

Newsgroup: comp.sys.atari.st
Date: 1998-02-01 00:00:00 UTC
From: pyryh@NOSPAMicon.fi
Message-ID: <34d47ccc.9566009@news.inet.fi>
Source record: 108613

I found my 520STfm and though that it would be intresting to check out what you can do with it these days, if anything at all, and do people use it. So is 520 STfm with 512k ram usable in any way or should I get some TT or something (a one with a separate keyboard etc; pc style) if I was to use an Atari or maybe I should just get more ram + a harddisk for this one?

So how much ram can/should I add and how much are they worth these days? How about harddisks, I presume they should be SCSI, but how about the size, how much can an Atari handle etc? How much should I pay for one of those?

The TOS is 1.06 German:-), so how do I upgrade to a newer one, software/hardware? I guess the newest ones are 2.x.

> version 1.0 dated 1997 Dec 22 but I canï¿½t get it.

The problem is in how the mail programs handles SMTP commands to the server.

If a addres for example my own is sent with the name like this
RCPT TO:<erikhall@tripnet.se "Erik Hï¿½ll">
the server dont like it.

It must be sent without any name, only the addres is valid
like this:
RCPT TO:<erikhall@tripnet.se>

The program needs to remove any other things than the mail address.

Best Regards
Erik Hï¿½ll

*S*N*I*P*

I'm currently using a NEC Multisync 5FGe, it's 17" and a very nice display. I've also used the Gateway Crystalscan 15" monitor (it's an Autosync of some description) and it was pretty good too.....be warned though, the big multisyncs take up a lot of Desktop real estate, they're a good 6" deeper than the 15" ones...

>You might remember my previous posts about Junior Office and faxes.
>Although I said I had it working now, I have since realised that there's
>still a problem.

I had JO up and running very easily, however it was next to useless with about 1 in 2 other fax machines failing to regonise the files JO sent. I had a very technically aware friend receive test faxes from me on his machine and he spent hours trying to figure what was wrong. His PC-based fax machine took the the connections perfectly, but these image files JO sent were either garbled on screen or produced an error message depneding on which fax software he used at his end.

Because I could not rely upon Jo to send faxes I bought STraight Fax soon afterwards. So far, it has never ever let me down. I've sent nearly a hundred faxes all around the UK and to other parts of the world, and there have been no problems at all. People have actually faxed me my pages back with amendments etc, and the quality is excellent!

BTW, it receives faxes just fine as well. About the only problem I have with it is that it can occasionally clash with other comms programs, so a quick reset is in order just to make sure all is okay before I go online, but apart from that it's been a worthwhile buy. I export my letters from Papyrus as a 200 dpi IMG and fax the image or convert is beforehand to a fax file to save a bit of transmission time.

Best regards
Mike Kerslake

I have released all F10 Atari Software as freeware.

Robo Bop - The Atari ST MIDI Rhythm Editor
Launcher - Launch any program with 1 mouse click
Nosey II - Find text in files
MIDI Tool Box - Calculate delay times and much more
Lex-Lax - Lexicon LXP1 and LXP5 editors
Agenda - Calendar for ST resolutions
Time Sheet - Recording studio (or other) manager

They're at:

http://newmex.com/f10/atari.html

Agreed, but I'm only using two cables - an ICD one from the Atari to the Link (which has always worked fine), then the MiniS --> Zip is by the official Iomega Zip autodetect lead (and a 50-->25pin convertor also made by Iomega especially to link the autodetect cable to a 50pin SCSI socket). So I have to assume the leads are of Ok quality...

Paul wrote:

> Did you try putting the Minis (when it was terminated) at the end of
> the chain initially or do you not have the cables for it?

I haven't tried this for two reasons - firstly, it would involve buying about 30 quids worth of extra cables, and secondly, the Zip connection won't power the Link2 because it doesn't supply termpower. Is there a simple way of providing termpower to the Link without getting a soldering iron out? (my knowledge of electronics is not great, so I'd rather not tamper on this level!) If so, then this is certainly something I would like to try (especially if I can't get it to work any other way)

> As the chain is, maybe you should check the dip switches on the Minis
> and check that it is supplying TERMPOWER too.

Yes, the MiniS supplies termpower. There are two sets of jumpers on my drive, one set for determining the SCSI id, and the other set that controls termpower, parity, "power up option" (??) and "reserved". I have experimented with different combinations of jumpers but nothing helped... :(

I've got a SCSI terminator ordered from Maplins that should arrive on Monday, so I'll stick that on the Zip and pray that it works...

Thanks for everyone's help so far, I appreciate it - maybe one day I'll get the damn thing working..! :)

16:09:55 +1100 that you wrote:

>> By the way... is there any use for my FTP site list any longer? Does anyone
>> use it at all or are my updates and postings just a waste?

A classic case of not knowing if its worth the effort, Web pages are
the worst, all them hours getting them right and not knowing if anyone
used them,

Why not stick a counter on the page? then at least you will see people
are visiting it...Geocities do allow a counter don't they :)

BTW Yes I use it...have done for as long as I can recall :))

>I was curious if anyone knew of any Atari ST RPGs that put >today's RPGs to shame

Well, I'm not sure what you mean when you say "put to shame" but there are quite a few very good games that I have enjoyed:

Dungeon Master & Chaos Strikes Back (CLASSIC games)
Amberstar
Knightmare
Captive (RPG in outer space)
Alternative Reality: The City
Defender of the Crown
Bloodwych (another CLASSIC ... IMO)
Hero's Quest
The Kings Quest Series
The Phantasie Series
The Ultima Series
Shadow Gate
Bard's Tale
Temple of Apshai (this one started me on RPG's)
Curse of the Azure Bonds

There are many more, but these are one's I'd highly recomend. While maybe the graphic's are not state of the art, the games are still fun and challenging to me.

-> member of our user group has a Falcon with FalconSpeed installed -
-> runs Windoze 3.1, and I'll bet any v of WP or ??? you want.

-> Of course, you have to find and install a FalconSpeed to do this.

-> "The Poor Deluded Soul" - tderrick@acpu.com

Hello! I'm the one in Tom Derrick's Atari User group that has the Falconspeed installed in my Falcon running DOS 7.0 and Windows 3.1 (on an Atari SC1224 of all things)!
It's a 16 mHz 80286 hardware emulator. It works pretty good and getting all this installed on my internal hard drive and IBM applications and Atari applications co-exist pretty well (unless you use Atari files with the .BAT or .EXE extensions) in the same directory.

I haven't been able to use the modem or CD ROM drive with it though. I use it for Quicken and some programming applications. It will do Word Perfect pretty well at full 286 emulation speed.

If you can't find Falconspeed anywhere (more than likely because it's been discontinued some time ago) another option is to find a software emulator called SoftPC which is a 80386 emulator found on the Bird of Prey CD Rom marketed by Toad Computers when they were in the Atari business. I never had a chance to try it but it might be a more viable option than trying to locate Falconspeed (which I bought from Alex at ATY computer about 5 months ago).

For you ST users they had AT-Speed, an 8 mHz 80286 emulator which I also had the pleasure of using. I still have that and I offered to donate it to our local user group with all the other funky hardware upgrades I have to build a suped-up super-duper mega-ultra ST. AT-Speed does much of what PC Ditto could not do.

Later,
James

-> "The Poor Deluded Soul" - tderrick@acpu.com

Just to add to what Tom said You may consider the connectors of the
devices you have in the chain. I say this from my experience I had
installing a new Plextor CD ROM drive in an old case. I hahad to use
the original cable with the two Centronics SCSI connectors on it. I had
no idea that one of the wires in one connector shorted to another which
was causing me endless problems. The new CD ROM drive wouldn't work, my
HP Coyote drive was acting funny - producing all kinds of weird errors
(only when the CD ROM was hooked to it) and finally it crashed and I
lost a half of gig of data.. Naturally I suspected the Plextor drive
itself and returned it for a new one which also failed. Next I suspected
the Extendos Driver and I contacted Roger to help. He said get a new
case for the Plextor and that fixed the problem.

-> ... Without my ignorance, your knowledge would be meaningless.

Thank�s Erik, I just new that it was Emailer. Now i�t�s up to ASH to "filtrate" away the name in a nextcoming version, �course I think more and more providers is going to use this free GNU software firewall, not only here in Sweden.

I now managed to "get around" this problem, I have a account on a american SMTP-server to send mail through. My VISA-card is going to leak here, not much but... so ASH should hurry up. I�m going to test this now, �course I�m now sitting with Outlook again. I have found a discussion about this particular problem in maus.sys.atari.internet, a Atari user called Alfred Radauer. They (in maus) just ignore him with strange solutions. I don�t know if it�s o.k. to citate his message, so I don�t, but I now send a copy of this message to him, so he is aware that I mentioned his name and problem here at this newsgroup.

The followup this maus-discussion, I refer to news://maus.sys.atari.internet
and the "Probs E-mailer" discussion there.

Best Regards
Mille Babic

This is quite right, the list is useful, especially to those Atari users
that have just come online.

> 2) nobody uses it any longer...

Not sure about that. I keep looking at it, and it was a helping hand when I
accidentally deleted my server list for Newsie.

> I'd like to hear if you all need continued support for this list, if I only

> list so I need to ask :-)

I think it may be best to keep it as it is, ie. posted once a month, with
a seperate posting beforehand if something changes. That way, newbies get
the full list monthly, and everyone gets to see any updates inbetween.
Mind you, posting weekly updates would mean a little extra work on your
part, so itwould be upto you to decide if you want to do that.

If they are MPEGs you need something like 1stGuide to play them. It seems
to handle all the MPEGs I've thrown at it. MPlayer doesn't handle MPEGs,
only AVI, MOV or FLI/C/H/M and animated GIFs.

BTW, where'd you get them, for research purposes only, of course? ;)

>this one?

Everything depends on what you want to do with your ST. But you're right
that 512K is not enough to run most modern applications. 4Mb and HD really
boost an ST and you can do most of what you would do with any other computer
(reasonably speaking).

All your questions are answered in the Quick FAQ...

1.06 and 1.62 were for STE only, you probably have 1.04.

Cheers,
Nick

I have tried a few newer MPEGs I found floating around, and had problems with MPEGDSP player too. I know that the Atari players can only display certain frames, and maybe the creators of these files are compressing them in a way that is incompatible for our players. If I knew where to get this Baywatcher MPEG (for research purposes:) I could try it on my Mac using Sparkel and find out how the file is formatted.

Can someone explain to me why I can be disconnected many times when nearly finishing a download? Files that are 600K to 2meg in size, I cross my fingers whenever I am near 80% finished as more often than not I lose the connection and the file transfer is discontinued. Is there a specific transfer rate that must be achived? Will a faster serial port help things. I am currently running at 19200.

I noticed when using NEWsie that I have a little more success than CAB.

What should I be looking for here. I can't stand getting all these half finished zip files and having to start over again.

Is there a time factor involved?
Well thats enough.
Brian.

Well, I have truly discovered that I am not command line inept. BUT MY
520ST WITH TOS 1.0 IS:-). I thought it might be a problem with Capitals
but I still can't get it to work. Luckily it all works fine on my STe, so
I am really puzzled. I would be surprised to hear that NO ST TOS 1.0 users
have ever used Gzip? I wasted two weeks recently and many years in the past
because I thought was a total screw up with a TTP. I had never gotten a zoo
ttp to work either. However LZH and ARC TTP work fine on the 520ST.

I am interested to hear if any other TOS1.0 users have had a problem with
GZIP ttp or Zoo.ttp? I think if I didn't have this STe here I would have
went insane trying to follow everyones simple instructions to no avail.

Again thanks to everyone who did answer in this thread. TTPs had been bothering
me for years, and I am happy/puzzled to find out that I wasn't the total
cause for failure.

>this one?

512Kb will do quite a lot for you - Atari code is very efficient and
does not need the oodles of Mb like the PC. Some people will tell you
that you can go web browsing with 512Kb but I would worry about the
life of your floppy if you did :-)

>So how much ram can/should I add and how much are they worth these days?

>those?

If you can find a Marpet or Frontier RAM expansion you can go to the
max. of 4Mb. The best initial move is to go to 2Mb and add the rest
later if you really need it.

The ST will always require a DMA->SCSI host adapter. At the moment the
Link 2 is on the market. You could look for second-hand AdSCSI or
Supra cards. The Atari can handle all SCSI device provided you have a
modern driver. You can buy HDDriver v7.xx or try out CBHD (PD).

>The TOS is 1.06 German:-), so how do I upgrade to a newer one,
>software/hardware? I guess the newest ones are 2.x.

Hmmm ... your best bet is to use Magic, a complete TOS replacement.
But this consumes RAM so you could not do this until after your RAM
upgrade. If your TOS is >1.04 there is no real point in upgrading ROM.
All, after 1.04 handle HDs OK.

Make sure STinG is active in the STinG internals CPX. You know, that message you get when you enable the dialer -- "STinG is not yet active"? That's the clue. Click on active in the CPX and everything should work. Contrary to some reports, I get the same speed or better with STinG than STiK.

There is no binaries newsgroup for Atari.

If you look in this newsgroup you will find that Hallvard publishes a
regular list of Atari ftp sites.

Floppy boot up: OK.
Tried with a "clean" system: no luck.
Reinstalled AHDI 6.6061, Harlekin, XControl, MagiC 5.11. No luck.

Diamond Edge found that the Partition Info showed that C had "shifted",
starting at 2 rather than 10 as before. D also became unreadable.
On reestablishing the previously saved boot info (which I've had to do
on other occasions), things got worse: the whole HD was unreadable ;-[[

Nothing for it but to reformat, re-partition C to F, reinstall AHDI
and whatever back-ups I have. Result: first boot was completely
successful, with Harlekin and XControl OK; but XControl again does
not load on subsequent boot ups (nor do COPS or ZControl).

So how did I logon and send? I disabled STinG (cos no CPXs) and used
STiK. HSModem and Harlekin's HPGs handle the serial ports (Serial2
with 110 baud). I've also transferred valuable data files to external
partitions! But without CPXs I cannot tame the printer (for Texel),
sigh......

Thanks for your suggestions, Guy (guy@swampdog.demon.co.uk).

2145. Re: CAB

Newsgroup: comp.sys.atari.st
Date: 1998-02-01 00:00:00 UTC
From: news@whalley.demon.co.uk
Message-ID: <34d4f7dcb2f360@whalley.demon.co.uk>
Source record: 108660

on Sun 01-02-98 21:33 Vernon L Enriques wrote:

>Please tell me where I set my paths for CAB/OPTIONS/Cache Folder?

Depending on your version, you use the Access paths entry in the Options menu or a similar menu entry. First create a cache folder somewhere convenient on your hard drive. You may find that the install process (commercial versions) or unzipping the archive (freeware versions) creates a cache folder in the CAB directory. You can use this but you don't have to. Click on the box for the cache path and select your folder in the resulting file selector. Don't forget to set some sensible values in the Cache setup dialog, too. See the manual for advice on this.

>What is an .xbm file?

An X Bitmap graphic file. This is a monochrome bitmap graphic, the Unix/X window equivalent of GEM .img files. It's one of the two original standards for web graphics (the other being GIF). JPEGs came later after Netscape started supporting them, as I understand it. XBMs aren't that common as being monochrome only they are a bit limited. I think they were one of the two supported formats due to the early web development being done in Unix environments. You can use an external viewer for them but CAB can also display them internally. Take your pick!

>Also under same menu option: The Editor for email? is that
>your computer or the ISP's?

It's on your computer. CAB works with a TCP/IP connection, rather than a shell account which would be the only way to use an editor on a remote machine such as your provider's. You need a standard text editor (Everest for example) so you can use mailto: links on web pages with CAB. NB CAB only sends mail, it can't receive it. You will also need to set some environment variables in your default.cfg for STiK or STinG for CAB's mail to work:

EMAIL=you@your.isp.com
SMPT_HOST=your.providers.mail.host

If you are already using a suitable mail program on your Atari (eg Newsie, Okami with a little ingenuity(!), any other which can take a mail URL as a parameter when being launched), you can use that in conjunction with CAB for this purpose and then keep copies etc as with the rest of your mail. You need to set this in CAB's Internet clients dialog box.

>Help please!

Hope the above is intelligible,

Do I still need to use the CAB_JPEG.OVL with CAB 1.5 on a 1040
STe? I am using the 1.2716 version of CAB.OVL.

2149. Some 520ST questions

Newsgroup: comp.sys.atari.st
Date: 1998-02-01 00:00:00 UTC
From: james.burr@acpu.com
Message-ID: <886373901@acpu.com>
Source record: 108664

You wrote:
-> I found my 520STfm and though that it would be intresting to check out
-> what you can do with it these days, if anything at all, and do people
-> use it.

Yes. Lots of people all over the world still use them. It really depends on what you want to do with it. I was using mine to design prototype PC boards for photo-etching, word processing, telecommunications, MIDI music, games, desk-top publishing, program coding, etc.

-> So is 520 STfm with 512k ram usable in any way

Yes, if it still works.

-> or should I get
-> some TT or something (a one with a separate keyboard etc; pc style) if I
-> was to use an Atari or maybe I should just get more ram + a harddisk for
-> this one?

That decision is yours depending on what you whant to do.

-> So how much ram can/should I add and how much are they worth these days?

I had 2.5 megs and later added 4 megs in mine. The 520 STFMs I see usually sell for about $60.00 U.S.

-> How about harddisks, I presume they should be SCSI, but how about the
-> size, how much can an Atari handle etc? How much should I pay for one of
-> those?

You need a host adapter such as the Link '97 if you want to use a hard disk other than the Atari Megafile units. The link '97 and the Link II run about $100.00 U.S. I had two hard drives. One was a 104 meg Quantum and a HP Coyote 1.4 gig unit which I'm currntly using with my Falcon. I to have the boot partition under 25 megs and the others had a maximum partition size of 500 megs with ICD HD Utilities. The price you should pay for one should me fair market price. The older ones are considerably less than the newer 9 gig units.

-> The TOS is 1.06 German:-), so how do I upgrade to a newer one,
-> software/hardware? I guess the newest ones are 2.x.

I don't think you can upgrade to a newer TOS for a 520 ST without special third party hardware. TOS 2.0 and above as far as I know were designed for STe machines. Your option is to get the Magic 5.x replacement OS or Geneva w/Neodesk.

Ok, but then you need to praise your luck that your ISP allows this. So far,
every ISP I've seen would simply disconnect when your machine reboots, as they
won't tolerate a second attempt to renegotiate the link.

>> So have the port inactive by default, and your comms problems will be gone.
>
> Usually it is, unless I'm actually connected.

But this means you cannot complain. If you reboot with the port saved to be
active, then the port is allocated to STinG. If I'd change that to not be,
then you won't be able to simply restart the machine while keeping the
connection.

Who told you that stupid nonsense ? STinG works very well with MiNT, in
fact many people are using them together.

MultiTOS is an unfinished, bug-ridden, AES replacement, for which it is
very difficult to develop system software. This is because system tools
are much more likely to strike bugs in the OS. While MiNT is fairly OK
in terms of bugs, MultiTOS seems to have bugs in every single kilobyte
of it. It is incorrect, unfair, and silly, to blame either MiNT or STinG
for those bugs.

> I'm quite happy for now to use Stik with Mint but I would like to go
> back to Sting in the future (to use PPP)

Purchase a decent AES, and STinG will work well. All XaAES, oAESis and
NAES are proper replacements for MultiTOS. Even though XaAES and oAESis
are unfinished too, the parts that work, work well. NAES is a true and
complete replacement for MultiTOS, it is stable and well usable, the
only drawback being that it's commercial, i.e. you got to spend a little
bit of money on it.

That's true, the current CAB.OVL for PPP-Connect does not support
authentication.

> The site was constructed using a MAC and Adobe PageMill 2.1 and the

The CAB.OVL for STiK and STinG does support authentication. However,
it's got a serious bug that prevents authentication on the first attempt
usually. AFAIK, it usually works when tried the second time straight after
the first attempt (the failure).

Message-ID: <34d5462e.0@news.ghgcorp.com>
Source record: 108678

I have an interesting dilemna... I am a musician that purchased a 1040STf back in 1989 for MIDI and I have always used floppies for storage. I have had someone give me an old Atari SH204 hard drive and I figure I'll need some kind of driver to make it work. I still use my ST for MIDI, and I want to implement the hard drive... and I just found the driver for the SH204... how can I get this file into my ST (from my PC)? Any and all suggestions are appreciated.

ps. I downloaded the TOS emulator for the PC... but it says that you can't use the floppy drive... or have they fixed that?

James

I've had the same problems downloading with CAB. I've never been able to
figure out why.

Also, lately I've been getting a rather strange error cconws-ed directly
to the screen and overwriting CAB's display. The error message is:

unknown error -3

This usually happens when CAB can't make a connection. Cab then tries
another 3 or 4 times to make the connection. Each attempt takes 1 - 2
minutes, while this is happening I can't do anything else. It gets
annoying having to wait 4-8 minutes before I can try another site. Has
anyone else seen this error?

Brad

Wouldn't these be self-extracting MS/DOS files????? Often you can just
unzip them, as they are usually zip files.

Tom, I was using the PTC1426 with my Falcon, but now I've got an Electrohome GPM 1701 multisynch. Its got onscreen digital controls, and it rules. It will "memorize" any new res that it finds, and then the next time a program that uses that res is run, it will automatically switch to it. Its great from my Falcon when I boot up in SVGA and then run a Eurodemo such as the Lost Blubb and the monitor switches down to RGB without me doing a single thing! :)

Not sure about the TT though-I've never owned one. I do think the picture on the PTC is a great one though! :)

And it all rests on the level of interest. Just 6 articles in AC would
require 12 month's commitment of course. Okay, the articles could be
prepared well in advance but there's still the feedback to be dealt
with, which might require changes to future articles.

Don't tell them! I don't think I've ever mentioned in documentation
what language I write my stuff in.

[tangent mode on]
I was reading a totally unrelated thread in a borland newsgroup a
couple of days back. I forget the exact details but it went something
like this ...

C++ programmer sez to company "yes I can develop your Visual Basic
DLL's provided you let me use this new add-on for it that lets you
write VB DLL's in C++". Programmer then proceeds to use a C++
compiler.

... and I'm not so sure it was a joke either!
[tangent mode off]

>So anyway :) I honestly wouldnt have the incentive to do the above for
>one or two people, but if I could get ten people who are determined to
>make a quality game and dont have a pre defined bias towards STOS and

That's the problem - not enough bodies!

>If interested then go get Heartland to see what i mean as thats what I
>would teach everyone to make but with your own artwork:) ho and thats
>a couple of yrs old now, I can make it more compatable than it is :)

You're right. STOS does what it does well - and there are more users
of it than Mwc! ;-)

Afaik they are the only 2 for which the sources exist. On the other hand there are no major bugs in either Lattice, PureC, or even Mwc for that matter. It really boils down to a question of library support. The situation at the moment is one where a lot of us posess our own custom additions which make no two compilers of the same brand the same. This is to be expected with C but in the atari world it may have run amok simply because there is no "company" bringing out updates.

On the positive side you can end up discovering one day that you know a lot more than you think you know - and there's nothing more satisfying than knowing you have not only written the application, but a majority of functions it relies on as well! <G>

Sure, but my point was that there are ISPs out there who REQUIRE the
use of PAP. Dunno if they'd say "don't use PAP" ;-)

Basically, if one can do a manual login with a terminal emulator (i.e.
enter account name and passwort, and get it accepted), chances are good
one could get away without PAP.

The explanation appears to be that some stupid Windows TCP/IP stack requires
you to enter it, but then does not use it anyway.

> Whilst I've got your ear so to speak, can you tell me what entries I should
> make under "environment" in the dialler please?

You cannot edit them in the Dialer with the current version. Only way to
set them is putting them into the DIAL.SCR. Check out the sample *.SCRs,
one of them makes use of this.

They're basically the same thing as the entries in DEFAULT.CFG. The main
reason I've added it to the Dialer is a conceptual one. Some of those
entries are ISP dependent, but the DEFAULT.CFG are system defaults that
are meant to be ISP independent. It only becomes really important if
someone uses more than one ISP. Up to now, he always had to change the
DEFAULT.CFG in order to use proxies, as an ISP would not let him access
their proxy while using another ISP. Now the HTTP_PROXY etc settings are
termed environment variables which can be set by the Dialer. All you need
to do is putting the lines into DIAL.SCR. As one would of course have one
DIAL.SCR for each ISP, the proxy settings can be individual for each ISP.

> PR> You might need to allocate more internal memory in that case
> PR> though (ALLOCMEM in DEFAULT.CFG).
>
> Now you did it. Now I need a lesson in ALLOCMEM. ;^)

ALLOCMEM specifies the amount of memory STinG allocates at boot time. It's required because the TOS Malloc() and Mfree() calls have some drawbacks, most notably they can't be called from interrupts. This memory is used for buffering IP packets mainly. If more TCP connections are used at once, i.e. if you run several clients in parallel (occasionly I run an IRC client in the background, an FTP download in the background, let CAB fetch a larger web page in the background, while typing and reading in and from a Telnet terminal connection), you'd give it a bit more memory here. I generally use 150 kB or 200 kB for this, you can give it another 100 kB or maybe even 200 kB for safety if you got enough memory.

My mentioning of the ALLOCMEM was on how to make TCP buffer a few more packets before it asserts it's (virtual) handshake lines. You need to increase the TCP receive window to achieve this. You can change this in DEFAULT.CFG, but be aware if you use the Protocols CPX, it'll override this by it's own value. So you need to change it there too. Obviously, if TCP is going to buffer more data in the internal memory, you might need to give it some more by increasing ALLOCMEM, it's been tight before.

The RFCs state clearly how the real name may be included. IIRC two forms
are allowed :

perot@pallas.amp.uni-hannover.de (Peter Rottengatter)

and

Peter Rottengatter <perot@pallas.amp.uni-hannover.de>

(Hope I got 'em right). Of course in both cases the real name may be omitted
completely, as you Erik pointed out for the second one.

I'd love to know why authors so often think they can ignore this. The ASH-
Emailer is in good company here, there are quite a few mailers which do this
incorrectly. However those other mailers do some other things alright which
the ASH-Emailer does not.

This can be done too by just decompiling the HYP using the HCP.TTP that comes
with ST-Guide.

I believe you can print the ST-Guide pages while being in ST-Guide ?

Anyway, eventually there will be a complete HMTL version too.

Interesting thing. Please let us (or me at least) know when you succeed.

> Briefly the server does the following things:
> - requires a certain login name and pwd
> - after logging in it requires my home phone number
> - disconnecting

I believe you can do this with any terminal emulator, like CoNnect ? With
CoNnect you can even write a script so that it'll be done automatically.

After disconnecting, you need to terminate CoNnect immediately in order
to release the modem port. Then, click "Enable" in the Dialer, and once
the phone rings, click "Connect".

Make sure you have created an appropriate script for

> - requires to log in as user 'ppp'

Leave the phone number and the init string empty, and try an ATA as the
dial prefix.

> and that's all.

And that's all. Hopefully ;-)

>feel comfortable doing it myself. Thanks.

>
>

It depends what machine you are upgrading. Putting TOS2.06 in an STE is really VERY simple, remove the socketed chip and put the new ones in, then 2 jumpers have to be soldered. Just about anyone can do that. If you don't feel comfortable with it, anybody who isn't too clumsy should be able to do it for you.

If it's an STF, you can get a special board that also requires minimal surgery on the machine. Usually the instruction that come with them are pretty straightforward, and then again, anyone who has already used soldering iron should be able to do this.

Finding a specialized Atari dealer/repair place will be pretty tricky. Maybe you could find a TV repair shop or someone who will be willing to do it for you...

Cheers,
Nick

Guido Vollbeding (guivol@workaholics.net) wrote:
:
: The program comes with a short english readme with most important
: usage information and where to go for support and questions.

I think you must have missed my post and only seen Mr. Croker's follow-up. My comment was simply that there was a lot more under the hood of 1stGuide than the English Readme file described.

I also explained that the reason I am not a registered 1stGuide user is because what I was already a registered GEM View user when I discovered 1st Guide, and besides, what I really want is a tool that can convert picture formats, which GEM View does but 1st Guide does not. I also lamented the fact that GEM View is no longer being updated, my joy that 1st Guide continues to be updated, and my belief that sooner or later the new technology would win me over and I would register the still living product, although, to be honest, I mostly use CAB to view images on my Atari these days (in my trial of 1st Guide it did a much better job of making the most of the current color palette though).

: It's people like you who prevent reasonable software development for
: your glory Atari platform. This forbidding behaviour will only
: precipitate the ruin of the Atari platform. Good luck! And thanks
: for giving motivations to drop the Atari development more quickly...

I'm not sure how my comments, restated above, should be considered forbidding to softwaqre development.

> use it at all or are my updates and postings just a waste?
> I'm wondering since virtually nobody responds or comments the list any
> longer, so this might mean one of two things:

Your pages are probably the most useful to Atarians out there, in my opinion. Yes, they are used extensively, and they are set up so that everything works smoothly.

As for posting the FTP list, I don't know whether this is necessary - although I can see that feedback about sites coming and going is necessary to you, and that this is a way of generating that - perhaps just a list of changes once a month or so?

Thanks for all (and I mean All) the work!

> controls' before I go out and buy something. Details, please?

Monitors with Digital controls for screen shape and position generally offer a wider range of movement than montitors with analog controls. On an unadjusted monitor, TT Medium appears as too narrow and tall, and a little to the left, with a white border around the active picture area (i.e., it doesn't use the full SVGA picture area - oh those wacky Atari designers...). You can't do much about the white border, but with wide enough control, you can stretch and move the display around so that TT Medium occupies most of the middle of your screen.

The NEC MultiSync 4FGe that I'm using now has a great range of control and allows you to use most of the available screen area with TT Medium.

2187. ST+ Fanzine

Newsgroup: comp.sys.atari.st
Date: 1998-02-02 00:00:00 UTC
From: paxton@zetnet.co.uk
Message-ID: <34d6edde.21433617@news.zetnet.co.uk>
Source record: 108492

ST+ The only Monthly printed ATARI Publication.......
http://www.users.zetnet.co.uk/paxton/

The Fanzine is printed and ready, Master copies have been sent to the worldwide distribution points and all we await now is the February 7th release date,

Order now.....Because the Fanzine is copied, there is no deadline for orders, just ask for a copy any time, Overseas is worked the same way, distributors have a Master and will send you a copy on request,

Deadline for Adverts and Copy for the next issue is a zero tolerance February 20th

email Dave Hollis (Editor) tinman@zetnet.co.uk for more ordering info, or visit the ST+ web page for masses of info as well as a preview section, The web page is zipped and available to download for off line viewing at
http://www.users.zetnet.co.uk/paxton/zips/stp.zip and is approx 176kb

Price is set in the UK at 1.50 (One Pounds fifty Pence), There will be a full breakdown of the costs of every edition of ST+ in the following months release, No money passes between ST+ and other distribution points, They all work on a none profit basis and you should see the web pages for more info,

There is an ST+ Mailing list where you can discuss or debate all aspects of this Fanzine or any other ATARI Readable publication, just send an email to Majordomo@spodden.zetnet.co.uk with the words "subscribe stplus" (but without the quotes) and after following the authentication prompts you will be added to the already growing list.

** NOTE ** The whole design and concept of the way the Fanzine works ensures that no one can make money, but equally none of us can lose money, thus we are not dependant on sales and don't mind if no one buys it, we have enjoyed making it so much that we don't really care if no copies are sold <smile>, However if you do take a chance, then you will find it is easily worth the pathetically low price :) **

Hi to everyone !

A few weeks earlier we were talking about the possibility to add a
32000 color expansion (15 bits) to a Crazy Dots VME (obviously not the
model 2!) ...
Today I have received my expansion module from Dan Wilga but I need to
update my NVDIVGA.INF file ... to allow new resolutions ...
But I really don't know how to proceed ...
I hope someone with the same card will be able to show me the way ...
Please, any answer will be welcome !

Thanks to anyone

2191. Problems with STinG and FTP

Newsgroup: comp.sys.atari.st
Date: 1998-02-02 00:00:00 UTC
From: rosco@game-master.com
Message-ID: <6b4v8u$1to$1@wagner.videotron.net>
Source record: 108496

Hi Steve,

You wrote:
1) Are you using a serial fix (ie HSModem, FastSerial?)
2) What type of machine, Falcon, TT, ST
3) Have you checked flow control with the Serial.CPX that Peter includes
in the STinG package
4) Finally - what verison of STinG are you using and how are you
connecting, SLIP, CSLIP, PPP ?

I'm using HSModem7, on a MegaSTE. Serial CPX is set as follows:
Modem 2, 38400 bps, 8-N-1, RTS/CTS, Buffers 2048 / 2048, DTR selected.

I'm using STinG 1.12 for a PPP connection.

The delay rate set in the STinG internals CPX is 50.

In the environment section of the Dailer PTP_ROUTE = FALSE.

The modem is a GVC 28.8k with factory presets.

Most binary files DL'ed with STinG, (CAB and Newsie) are corrupted.
I'm having no problems with local DL using Z modem with XYZ.TTP. No
problems otherwise...viewing web pages, newsgroups, retrieving and
sending mail, all are being done with few problems.

Please help!!!

Well, I have got a complete game in C. If you are interested I
can mail you the source code. It has got all the important
routines for handling the keyboard, joystick, screen, colors
and music.

The best way to start is calling Superexec() to get into
supervisor mode (needed when you want to access the hardware
registers.

Try to decompress them with ST Zip, LHA or Unarj. Use on the
commandline:
x *.exe (I think it's for zip e *.exe).
If it is an self extracting zip, lha or arj archive it will be
decompressed.

Succes, Hans

> difficult task... My main concern is (you guessed) the keyboard.

I have put one of my ST's into a 19" rack. I connected the keyboard
wires
and the reset line to a female 9 pen sub-D connector mounted on the
rack.
From there I go to the keyboard with an joystick extension cable.
The keyboard was sawn in 2 pieces, just above the function keys. Placed
a new back in the keyboard (steel, covered tho whole bottom of the case
to give it a bit of weight), and fitted a male 9-pen sub D connector and
a new rest button.

Succes with your project, Hans

POP 3 is a protocol. a Mail server using this protocol will need a
POP3 client to retrieve your mail. POP3 is quite basic, not evoluated,
as opposed to IMAP, but largely supported. Ask your provider if they
have a pop3 server.

hm I have to say that yes, multitos is buggy, and has a lot of
problem, speed, compatibility.
However you state that Xaaes or Aoesis would be better, which is a big
mistake to say. Xaaes and Oaesis are much worse than multitos
regarding compatibility, faster than multitos yes, nicer, better
options yes BUT NOT SERIOUS for everyday use.
In this case, the old multitos would be better. YOu run MUCH more
program(old included) in multitos than Xaaes+oAesis combined.

>
>
>> I'm quite happy for now to use Stik with Mint but I would like to go
>> back to Sting in the future (to use PPP)
I am puzzled, if you have mint installed, why don't you just install
mintnet???? a lot of people don't want to use mintnet because it
requires mint, but you already have mint.

>Purchase a decent AES, and STinG will work well. All XaAES, oAESis and

Agreed, Naes is the only choice for serious work, it's FAST AND
compatible, Just the best. Once again, do NOT recommend Xaes NOR
oAesis as replacement to multitos.

I've done this but it doesn't seem to make any difference - I still
can't print in the background. I have tried using several programs to
print (eg. CAB 2 and IdeaList) including one or two that have an
option to print in the background but it still doesn't make any
difference. :-(

Thanks for your help.

AFAIK there is a interupt-driven printer-device available for MagiC.
If you run this it installs something like 'u:/dev/lp', configure
NVDI to print to this file (using the drivers-CPX) and you have
background printing.

There is also a similar centronics device-driver for MiNT, I use it
with a 1Mb buffer and it works fine.

Is there any program that will allow my ST to:
- import MIDI (.MID) files
- turn specific channels in a .MID file on or off
- transpose a .MID file/song up or down, or to a different key
- change instruments of a specific channel
and possibly even:
- view .MID files in a standard music clef and even print out a score?

If you know of anything, please respond. Thanks in advance for replies,

Randy Kwak

2217. Falcon HD problem

Newsgroup: comp.sys.atari.st
Date: 1998-02-02 00:00:00 UTC
From: james.burr@acpu.com
Message-ID: <886450577@acpu.com>
Source record: 108522

Howdy everyone!
Okay. Here's the scoop. Both me and a friend have Falcons. We both had Connor internal 85 meg hard drives originally in our machines. When we tried to use these hard drives they would work sometimes when we power up our machines. Other times we can hear them wind up to speed and then stop and wind back up to speed and so on until the Newdesk Desktop comes up instead of what should have booted off the hard drive. When it does work (about half the time) it does great until I turn the machine off and turn it back on. I thought I just had a bad drive until my friend reported the exact same problem with his 85 meg hard drive and decided it wasn't an isolated event. Both Connor drives. I'm reduced to using a Connor 63 meg drive now.

Anyone have any ideas on this phenominon?

I'm going to get a much LARGER hard drive but like to use this one as a boot back-up if it's a simple fix.

Thanks in advance for any ideas.

Later,
James

I have not got as far as your '3-byte' diagnosis, Alan, but, yes, I
get a similar effect with some items. I find that if I just sit tight
for about 20 secs. it clears and carries on. At the end of the
off-line read the newsgroup which contained the offending item has a 1
(rather than 0) in the left hand column.

How are you estimating 'the difference', Malcolm?

A spooled print will not come off the printer any faster - the only
difference you should notice is that the program doing the printing
finishes sending the data earlier. As most printers have a buffer of
their own you would be needing to print a file greater than the
printer buffer length before the spooler was useful.

Yes. The driver is DEV_FPRN.DEV which is installed as an 'XTENSION' to
Magic. This sets up the file u:/dev/fprn

2222. Need help with MegaSTe DMA

Newsgroup: comp.sys.atari.st
Date: 1998-02-02 00:00:00 UTC
From: kws@Radix.Net
Message-ID: <6b5fu1$gc1$1@news1.Radix.Net>
Source record: 108527

OK, I picked up 2 MegaSTe motherboard from Toad when they were selling them off. I have since tried to get both of these boards to boot off HDs connected to a ICD AdSCSI Plus controller through DMA with no luck. The machine appears to sit and stare at me. I have looked for the chip this is suppose to be the faulty DMA chip on the board, but have no found it.

Where is the DMA chip located on the motherboard?

I do not have the internal SCSI controller, does some jumper need to be set to disable it, or to boot through DMA? The controller and drives I am connecting to the DMA work fine, they boot on a 1040 STE with 1.6 and a 520 ST with 1.0/1.4.

The other relevant info....

The boards are not in a case, and I don't have a keyboard. I have been using a serial mouse on it (works GREAT) and want to make sure the things boots off of HD before I get a DEKA 2.

Both boards run the Bad Taste STe Demo fine. At least one board, if not both, have TOS 2.05.

I think I saw somewhere (not sure where though) that the 30 pin header next to where the floppy connects needs jumpers installed if not internal SCSI controller is installed, is this true?

Thanks for any help!

Keith

>anyone else seen this error?

I've had it, but never managed to pin down what causes it. Not even
sure if it's CAB or the OVL which is responsible.

BTW anyone else had problems with some sites when using form-based
queries etc (CAB 2.5d)? If you get too deep so the URL gets too long,
something horrible happens to the AES and text which should be in the
status bar, menus etc is displayed in a magnified version of the
screen font, just before the whole thing crashes. Makes some sites
unusable :-(

It's the kind of thing I'd have made a bug report on at one time, but
as the English version of CAB is now two behind the German one it
could be fixed in the current version already. Anyone know?

I don't begrudge Alexander Clauss one penny of his earnings from CAB,
but I do look back on the days when new versions were issued on a
regular basis with some nostalgia...

Hi, Yes your luck. Scorpio team, (apex) did a little cpx that will
convert between JPEG into GIF/TGA(another format which I don't
remember) and the opposite. It is pretty fast and works very well, It
also has some extra flags like smooth, 256 col max etc.
If you can't find jpeg68000.cpx I will send it to you via email mime.
Bye

2228. Use of -- in signatures

Newsgroup: comp.sys.atari.st
Date: 1998-02-02 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <4696410_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 108533
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

I've recently had someone ask me to stop POPwatch prefixing the signature file with <CRLF>--<CRLF>

I'm reasonably happy to do this, but can someone tell me what the standards/rules are for this? It was my understanding that all sigs should be prefixed with the above, that way programs can truncate any sigs or binaries etc. when you reply to an email/article.

I know Oasis2, Oasis1.3 (although it uses __ in error), and I'm guessing NOS all prefix the sig with this. NEWSie doesn't. Turnpike on the PC does.

POPwatch only acts this way when sending from NEWSie, because it has to append the signature to the end before sending email. All other POPwatch formats will be unaffected.

Anybody got any ideas as to what is correct?

Regards,
Gary

I have a:

4mB 60mB HD 32bit/32mHZ Atari Falcon for sale in the UK
(Reading Area).

I'm looking for offers, 200 pounds ono.

Comes complete with software, SVGA monitor, Viglen Keyboard via adapter
etc.

Please email me for further info, <stu95djn@rdg.ac.uk>

I would prefer it if it went to a 'good Atari home'.

From: greg_evans@delphi.com
Message-ID: <JPcldg6.greg_evans@delphi.com>
Source record: 108537

I had one night of success with STinG this past Saturday. Tonight when I tried to use it it can't find the modem. It tries to send the ATZ but gets nothing back. I have set everything to Modem 2 (I have a Falcon) and even restored the files from my Saturday backup but I can no longer connect. Flash 2 is working just fine as evidenced by this login. What could have pissibly gone wrong? I was about to try using an ISP today and I can't even dial out to test!

Help!!!!

Greg

Unsupported? That's not what I seen to have read. Is it still being
updated by the author?

>Hsmodem also doesn't work 100% with MiNT. There has been an
>attempt to correct this, but the author of hsmodem was

That explains it then. What does the author say? Does he respond? If so,
how does he respond?

>FWIW I think we could do with public sources for a decent serial
>driver.

That's just it of what I was trying to explain to Guy. Public sources,
rather than depending on what Steve Yelvington wrote. It's only one thing,
though I would like to see more examples. I've yet to find any, with the
exceptions of a BBS in K&R C, the Citadel BBS program. Heck, I could be
looking wrong.

So *THAT* explains it... I seem to remember seeing a receipt with Oregon Research's address on it. Who else distributes it in the US?

>To complete the information, the compiler originally belongs to a company
>named Lattice Inc. and ran also on other platforms. I think that HiSoft probably
>owns only the Atari-specific part of the package.

Yep... Lattice Inc is mentioned in the manuals. Is HiSoft still working on updates to Lattice C? Has Oregon Research mentioned anything about staying with selling Lattice, and have they done anything different since they made their announcement of selling out all their Atari computers and other stuff?

There was much talk, but I don't know that any ever got shipped.
I know many people whom upgrade from 1040's, Mega's to Falcon's and
wait and waited for this product, finally to move onto HP laserjets
and other printers since this never seemed to be widely available.

>the first attempt (the failure).

Peter,

Actually, in my case with maseratinet.com, its the first attempt that works, succeding attempts are the ones that fail. In other words, if I go to the page I can download one new page - any others produce the error. If I shut down CAB and then reload I can get to one more new page. Kind of a PITA, but I have been able to get just about all the info I need.

Thanks for the info - I didn't realize there was an insect infestation of that size in the latest CAB.OVL :)

On 31 Jan 1998 20:11:04, Eric Hays wrote:
>STiNG and CAB together do a reasonable job of multitasking on my
>computer, ...

Eric,

Running under MagiC you do have the option of "killing" the running app
by pressing the ESC/CONTROL/ALTERNATE key together. I would say that
this method will allow you to escape from the problem you describe about
80 to 90% of the time. Of course you have to re-boot CAB (or the
offending app) but this is usually quicker than waiting for the time
outs.

I agree with you on the length of the time out using CAB.OVL. My
experience has been if new data does not come in within 15 to 20
seconds, it is not coming. I think a time out of 30 seconds is more than
enought. Additionally CAB.OVL should allow you to escape the time out if
you hit the dreaded "Resolving Host" message instead of locking up the
computer.

A lot of this, though, seems to be nagging problems with CAB.OVL. Many times when the
system goes into the count down mode new data will only start to flow
when the OVL resets at the countdown end.

OTOH the latest vesion of the OVL does allow you to click on a link and
reset before the current pape is completely loaded. This has really
speeded up going through pages with slow loading graphics as you can
click on link and CAB will abandon the current page and start loading
the linked page as info comes in. Again this not 100% but darn close :)

: Uhhh? But Derryck says it is OK. Why do you think it's not adequate,
: Ray?

Roger,

I am glad you asked that question.

According to the author of the program there are changes to the CoNnect 95
that make it impossible to use the RSC file from CoNnect 2.46. You will
not have access to to all of the menus in CoNnect 95.

There was never an English resource file made for CoNnect 95.

But do not take my word for it contact the author Wolfgang Wander
at wwc@MIT.EDU.

2247. STiNG and Tosbox emulator on Wintel PC: does HSMODEM matter?

Newsgroup: comp.sys.atari.st
Date: 1998-02-02 00:00:00 UTC
From: tomio@aiTODmewTODco.jp
Message-ID: <34d57ee9.18452812@news.mew.co.jp>
Source record: 108552

Hi everyone,

I have successfully connected to the internet with an IBM PC running the Tosbox ST emulator. The stack used is Peter Rottengatter's STiNG (since my ISP only supports PPP, STiK wasn't an option). Web browser is CAB 1.5, with CAB.OVL. (Have Antmail, Newsie installed but didn't get a chance to try them yet.) Using a US Robotics Sportster 33.6 data/voice/fax attached to COM2 (still treated as "Modem1").

Quite a thrill when it finally worked, I can tell you...now I have one small, minor question, which is probably stupid: when running Tosbox and STiNG, is the HSMODEM package necessary? In other words, does Tosbox emulate the (buggy) Atari ST serial ports, or just build on the PC serial ports? Seems that if Tosbox doesn't emulate the buggy Atari ports, then including HSMODEM in the setup probably isn't needed, or even a good idea...(come to think of it, TB.INI does allow the user to translate "up" all speeds (so that 19200 becomes 115200 etc), so as I think about this I'm convincing myself that HSMODEM is NOT necessary with Tosbox.) Constructive counterarguments welcome and appreciated.

(If anybody is curious about how I got the Tosbox emulator running on an IBM PC connected to the internet using STiNG, send e-mail or reply to this post)

Cheers

>difficult task... My main concern is (you guessed) the keyboard.
>

I re-housed my STFM in a PC tower case, a large upright one that has 9 disk bays. I extended the keyboard interface to the tower back panel, connected it to a Din socket. I put 2 metres of cable on the keyboard & terminated it in a Din plug. I left the keyboard in the original STFM casing.

I meant to saw off the unused portion of the case & make the keyboard smaller, but thats a radical step.

Works well, has done do for 6 years now.

Plenty of room for expansion in there, I was able to sandwich the ST motherboard between the Tower case skins & the sub chassis, so there is still room for a PC motherboard, or memory boards or whatever.

MagiC creates the standard FRB, excactly like TOS does.
The XFRB is meant to be used by other drivers than the hard disk driver.

> not possible to locate the FRB buffer and mark it as none cacheable.

Of course the standard FRB can be located. The _FRB cookie contains its
address and this is a documented feature of TOS. If there is no _FRB
cookie, the machine doesn't require one. This is the case for an ST/STE.
There is no difference at all between the FRB under MagiC and under TOS.

> So does anyone know how to get hold of this FRB buffer under MagiC so
> that it can be set to none-cacheable? We have tried to get some info,

Obviously you didn't read the official information about the FRB,
documented by Atari and literature like the Profibuch or Atari
Compendium.

Like any other driver HDDRIVER uses this buffer and gets its address
from the _FRB cookie.

You should have a look at the GEMAR documentation. It depends on GEMAR
if and under which circumstances the XFRB is used or not.

The standard FRB is only used for hard disks, not for floppies. Floppies
have their own, smaller buffer, with a size of 1 KByte. The address of
this buffer is pointed to by the system variable _dskbufp.

AHDI doesn't support SCSI drives larger than 1 GByte. The same applies
to HDX.

Well I have tried to read through all the mails that you and Doug
sent to each others about this problem. I would think that this is
the case yes.

Here are some snippets from what Doug sadi back then. Maybe Uwe could
comment as well..

Doug said:

There *will* be programs which (wrongly) decide to skip the _FRB buffer
because the transfer address is below $1000000 - making some dangerous
assumptions about the hardware specification and memory model available,
but with that in mind you have to consider the following points:

1) This fix is primarily for AB users. All other 68040/60 machines have
hardware bus snooping so they don't need the fix. That means we can
rule out things that are not important to AB users when considering
a solution to the problem (see following points).

2) AB users don't need ST-ram. It's useless. You keep your screen there
and it's needed for audio and disk buffering purposes - and it can
be useful for using as a disk cache memory pool - but apart from that
it serves no beneficial purpose with so much 32-bit FastRAM
available.

3) Anything on the AB which requires ST-ram tends to require it because
DMA of some sort is involved. This means cacheable ST-ram is a bad
plan however you look at it. This does not really affect the screen,
but disk DMA and audio DMA *both* suffer from stale cache entries.

4) I produced a simple program for people who want to use software which
relies on direct DMA transfers to or from ST-ram, without passing via
the _FRB buffer. This program temporarily claims all free ST-ram, and
marks it as non-cacheable. It can then be used safely with the
following software:

* Audio samplers / D2D recorders.
* Low-level floppy disk copiers which ignore FRB (not found one yet).
* TCache63 when the cache pool is held in ST-ram instead of fastram.
* Other low-level HD tools like HDX and HDDRUTL, which don't use FRB

and
talk to the HD driver directly instead of passing through RWABS etc
(these don't like TSRs on trap #13, because they ignore them).

My tests show that almost all software, including most low-level copiers
and disk utilities are 100% reliable with a non-cacheable FRB, which did
not work properly without it. Only very few programs (like TCache) dare
to
DMA directly to ST-ram when FRB is made explicitly available, and so
must
be used with the other patch to mark all free ST-ram as noncacheable.

There are 2 drawbacks to marking all of ST-ram as non-cacheable:

1) You have to avoid running tasks from ST-ram or suffer major slowdown.
2) Your screen becomes non-cacheable.

Both of these are not much of a problem because:

1) ST-ram is not used for tasks when FastRAM is available.
2) The screen is 15% faster for most VDI tasks when it is noncacheable
anyway - so it actually improves performance as a side effect.

So, with the non-cacheable FRB alone, most low-level disk software will
work perfectly, with a few exceptions. These exceptions can be logged in
the docs for the user's own reference (I still know of only one program
which has problems with the FRB alone, and that is TCache).

With the non-cacheable FRB *plus* non-cacheable ST-ram, ALL software
works perfectly, so long as it is both 68040 and Falcon compatible.

I think that's not a bad 'yield' for such a simple fix - especially
considering the TSRs were much less succesful in general.

I did also find a mail from you saying this:

Andreas said:

But there, of course, is a solution: First try to convince the OS
that there is no ST RAM at all. This will _force_ all DMA drivers to
use the FRB. When you are able to manage that, the FRB solution will
work,
and I will make the FRB pointer accessible in the next version of MagiC.

So did you make the pointer accessible?
Also here is another excerption from your discussion.

Doug said:

> Nobody seems to believe me that this will not solve the problem.
> As DMA operations normally do _not_ use the FRB I will not make it
> accessible.

If you *know* that Magic does indeed ignore the FRB unless passing via fastram, then it will not work unless the rest of STRAM is made non cacheable also (which I have written a patch for anyway) - but if the FRB is *not* made available, then I can't even do that. All I can do is mark all of ST-ram non-cacheable before Magic loads, and that means bits of Magic might execute from ST-ram with the cache effectively off. If you can assure me that Magic leaves effectively no code in ST-ram when loaded into FastRAM, then I could do that instead without imposing any kind of performance penalty.

Doug said:

> BTW: Do you if the hard disk driver uses the FRB, or is this done by
> the kernel? I have to look this up because I do not know it by heart.

I believe it is handled by the kernel, because the presence of a _FRB cookie corrects otherwise faulty floppy disk access - and floppy disk is managed at a very low level by the kernel alone.

I have never seen any evidence that the disk drivers make use of the fastram buffers, even though some are capable of installing them. They just create the buffer and leave it up to the OS to do the rest.

Doug said:

> > So ACSI is treated differently from SCSI? or am I reading this wrong?

> No, that's right.

But SCSI has no access to the expansion port. If it's not buffered, it will
get clipped at the 24-bit address bus limit. I can't see how SCSI could ever work with FastRAM on the Falcon (using the expansion port) with no DMA buffering in between...

> The SCSI chip addresses 4GB, ACSI only 16MB of memory.
> The FRB is only used for ACSI (HD and floppy).

The SCSI chip may have a 4GB range, but it's not used in the Falcon.

Remember the expansion port is only a 24-bit address range, just like the CPU. There are only 24 address lines connected up.

Any DMA passing through the expansion port (if that is even possible, which I'm not convinced about) it will get clipped to 24 bits and cause all sorts of nasty trouble.

> And how do you treat SCSI?

Previously, I had all sorts of complicated routines patched around
the RWABS and GETBPB functions, but I have found that it is not actually
necessary with a _FRB cookie installed - so long as the ST-RAM being
used by the DMA is not cacheable during the transfer.

This would tend to indicate that all DMA passes through the FRB buffer,
including SCSI DMA (which fits the evidence about the expansion port
clipping or limiting SCSI DMA transfers).

This seemed to hold true with Magic when I tested it, but I had to
turn the data cache off entirely to get it to work without the nasty
patching routines installed.

BTW, something I said in my last mail was wrong - the kernel does *not*
handle the buffering of non-floppy DMA. The kernel handles floppy disk
(and probably other ACSI) and the disk driver (HDDriver or whatever)
handles the rest (SCSI DMA).

Well I'm not sure if this will make things cleared (I sure got
confused..)
and if it would help I could mail all the mails I have regarding this.

But maybe atleast Uwe could have some comments or maybe Andreas would
get
some new good ideas. Anyway from reading this I only get more confused.

Also, it should be aware that marking _FRB buffer none cacheable
under TOS and MiNT works just fine, it's only with MagiC this doesn't
work and cause disk corruptions on SCSI/Floopy.

But maybe this is a problem with MagiC which we have to live with.

Cause I think it was never answered as far as Win95 is concerned. I've done just as you said above, and ended up with disks that were unreadable and couldn't be reformatted on the Atari. Now I didn't do any scientific testing, but it happened every time I tried it.

Happy Festivus,

Well, for start there is no Berkely compatible socket for TOS. He is
considering STiNG support, but as it currently doesn't support
everything
he needs he wont make it working with STiNG, yet. MiNT should be
possible.
But I do agree, it's a problem.

Jupp it's a problem. Another problem which we have already talked about
that the Atari doesn't use a "standard" API. I would guess the Amiga
API is fairly compatible to the Berkely socket interface, or?

I was pretty sure I had read that HSMODEM7 would not be updated
further. How long has it been since the last update? Still, I
would love to be proven wrong.

>

> how does he respond?

I was not personally involved. What little I know, I heard from
Jerry Geiger: circa 1995, he wrote part of a MiNT serial device
driver for HSMODEM. He needed help from Harun to finalize the
product. Whatever the reason, the help did not come, and the
project foundered. The uncompleted project is available at your
local MiNT ftp archive. (Under hsmint.tgz or some such name.)

Well, it works very well for me in Win95. The only thing to avoid is long
filenames, that tend to do Bad Things on the Atari side (at least on my
setup), so just check every file is in 8+3 format before copying over.

>> -copy the file on it

>

It looks like the Win 95 vfat is the culprit.

Oh, the other thing is: DO NOT FORMAT A HD FLOPPY IN DD (720K), you know, with
a piece of sticky tape over the HD hole. It works sometimes, but the disk
always ends up going faulty sooner or later (the sooner option sometimes
meaning immediately), as there are differences in the magnetic surfaces of
both types of disks.

Cheers,

Nick.

> If they are MPEGs you need something like 1stGuide to play them. It seems
> to handle all the MPEGs I've thrown at it.

Well, 1stGuide is designed to handle all valid MPEG streams (including
systems, which many other players donï¿½t handle) on all Atari TOS systems
in all configurations (graphics modes)!
It can play a virtually unlimited number of MPEG videos independently in
separate windows at the same time, which is a unique feature even compared
to MPEG players on other platforms.

> MPlayer doesn't handle MPEGs,
> only AVI, MOV or FLI/C/H/M and animated GIFs.

MPEG is a reasonable, demanding, platform-independent, non-proprietary,
well-defined standard technology, and as such not very interesting for
typical Atari developers and users, after my experiences.

Michael Grove wrote:
>
> I have tried a few newer MPEGs I found floating around, and had
> problems with MPEGDSP player too.

The latest version of MPEGDSP should handle all valid MPEG-1 streams
properly (see http://www.mpeg.org/MPEG/MPEG-video-player.html),
but it has limited features and a limited running environment (Falcon only).

> I know that the Atari players can only display certain frames,

1stGuide can display *all* frames (I/P/B), so itï¿½s not a typical
Atari player!;-)
MPEGDSP only displays I-frames and skips P- and B-frames, because
reconstruction of the latter requires huge efforts which are not
recognized by Atari users, after my experiences.

> and maybe the creators of these files are
> compressing them in a way that is incompatible for our players.

No, itï¿½s rather vice versa: Usual Atari (proprietary) demands and developments are incompatible with reasonable standards developments.

You guys are really crazy. Why asking and supporting the author of the
software if you can make your own proprietary low-level patchwork?

The program comes with a short english readme with most important
usage information and where to go for support and questions.

Itï¿½s people like you who prevent reasonable software development for your
glory Atari platform. This forbidding behaviour will only precipitate the
ruin of the Atari platform. Good luck!

And thanks for giving motivations to drop the Atari development more quickly...

Regards,
Guido

2275. Registered Shareware Games

Newsgroup: comp.sys.atari.st
Date: 1998-02-02 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <19980202141001.JAA26145@ladder03.news.aol.com>
Source record: 108580

THE COMPUTER DUNGEON is proud to announce that we are the official U.S. distributors of the following fully registered Shareware programs:

Running from RDT Software
Mole Mayhem from Croftsoft
Trader 2 from Croftsoft
4 Game Pack from Cybernation
Deadland '96 from Justin Bloggins
Curse of Azriel from A.A. Covell
Heat Wave from Mikael Lundberg
Conquest of Elysium 2 from Solution Software

Each of these programs are fully registered (which means that the authors receive payment for their work) and come with printed documentation. Your purchase of these programs helps support the Shareware system and encourages authors to continue developing programs for the Atari ST and Falcon.

Check out our website for more information on these programs at:

http://www.mcs.net/~isis/dungeon/dungeon.htm

More full registered Shareware programs will be offered in our listings as soon as we receive permission from the authors to distribute them.

NOTE: if you are an author of an Atari Shareware program and would like The Computer Dungeon to distribute your program here in the U.S. and North American, please contact us at either our website or Email us at "ComDungeon@aol.com"

Thank You for taking the time to read this and we look forward to helping you with all your Atari needs!

Al Horton
The Computer Dungeon

Message-ID: <19980202142001.JAA15845@ladder02.news.aol.com>
Source record: 108583

The Computer Dungeon continues to add new products for the Atari user. We have recently added many used software titles, used accessories, and new software titles such as HD Driver 7, NVDI 4, CAB 2.5, Tetris 2, Power Up, Atari Classic Game Collection (Joust, Moon Patrol, BattleZone, Crystal Castles, Missile Command), Suzy B's Treasury Vol. II, Alien Thing, and much more.

We will be carrying Atari Computing Magazine and ST Plus Fanzine for our customers. ST Plus Fanzine will be included FREE with every order.

Full registered versions of top quality Shareware titles are available for purchase with many more on the way.

We are proud to be the U.S. distributor of "Running", the EXCELLENT new game for the Atari Falcon030.

To find out more about our products and services, point your web browser to:

http://www.mcs.net/~isis/dungeon/dungeon.htm

We are updating our website on an almost daily basis and will be adding a "Download Product List" option to our website this week as soon as we are finished checking in over 100 used software titles.

Thank You for taking the time to read this message and look forward to helping you with all your Atari needs.

From: dreibel@idirect.com
Message-ID: <34d5daf0.0@nemo.idirect.com>
Source record: 108584

I'm now getting the chance to actually work with my scanner (a Microtek E3 using Nima's ScanX software) and have been quite impressed with the results.

Now a question - is there any utility (shareware or commercial) that would allow me to load a .TGA graphic and save it as a JPEG? I'm using some of the scans for my web page and would really like to have them in TrueColour. GEMview doesn't have a JPEG saving module, and neither does Piccollo.

Any help anyone can give me in this regard would be greatly appreciated.

But if MagiC doesn't set up this cookie correctly (Andreas said that
MagiC
used a buffer of its own and deosn't use the cookie, even though it
creates
it) it wont work, will it?

It's still very confusing on how SCSI/Floppy access works on a Falcon
with
Fast-RAM (AB040). :-(

2281. Newsie on a RAM-disk

Newsgroup: comp.sys.atari.st
Date: 1998-02-02 00:00:00 UTC
From: aprice@postern.demon.co.uk
Message-ID: <886430821.26951.7.nnrp-08.9e987258@news.demon.co.uk>
Source record: 108586

I have been experimenting with Newsie on a RAM-disk, initially dumping the whole Newsie folder onto the RAM and altering the paths in Preferences to match. It does download faster, but the main reason is to stop the HDD from being thrashed when downloading newsgroups for off-line reading- I reckon this is what killed my last HDD under Oasis.

The question is: whilst downloading news items, the HDD access light flickers briefly once for each item. Has anyone any idea why it is accessing the HDD? It doesn't do it for mail.

Next step is to work out just which files are accessed during running Newsie, i.e. which files are used via the Preferences/path/working parameter. Unless anyone already knows?

Since I upgraded to v.0.84, downloading for offline reading has stopped splitting posts in the wrong places. There is now a different problem- if the last block of an item contains exactly three bytes, the transfer hangs, and I have to press Esc to continue. The item is accessible, and seems to be complete to the line with just '.' on. Anyone else experienced this?

Try alt.binaries.atari

Started about a year or more ago By Richard Tiejns (sorry probably bad
spello) and sort of moderated by him, I have posted the odd binary to
it and downloaded the odd file,
Unfortunatly like all "alt" newsgroups it not best supported, I used
it while with my long standing providor Airtime Internet Resources,
But havn't seen it in the Zetnet listing,

However unless its been removed in the last say 2 months, then
alt.binaries.atari does exist,

Sorry for the original lack of info.. I presumed I was missing
something and was looking for your answer <smile>

>
>There is alt.binaries.atari.d, which is useless.

Yup

>Let's be knowing of the others you know of, Tony.

Only the obvious, It may not be avialable to all newsfeeds, but it
does exist :)

A Doom clone of sorts, including Rise of the Triad and others, could easily be done. Apogee and id software would be prolly incensed to know we could easily rival their games like that.

Now for a BBS of sorts, or something like CAB and related programs, it could be done.

> there are tutorials, guides, articles and even idiot guides and

How about a mirror site, as I've said before? That way, if one site's unreachable, the other could be.

And yes, I'll be checking the FAQ out. I'm not that big on games, though I play them from time to time.

It may not, but let's hope whoever has the source code to it doesn't just decide to bitbucket it. That's when the product really dies, and people can now make copies of it, since it's no longer being sold.

>Is there any need? I mean, hsmodem does the job admirably.

HSMODEM can do fine, but I'm talking about people who want to create C code for accessing the modem. What HSMODEM does is that it allows certain speeds, that is, remaps the baud rates, when a piece of software refuses to run above a speed. So far, I've seen nothing newer than what Yelvington wrote in 1991 in that file. Is that K&R code or ANSI code? Is there any interest in getting Yelvinton back on here, even though it's been awhile? He's said that he may not be able to remember everything.

>And it all rests on the level of interest. Just 6 articles in AC would
>require 12 month's commitment of course. Okay, the articles could be
>prepared well in advance but there's still the feedback to be dealt
>with, which might require changes to future articles.

That's good, as it will always be a work in progress, just like the mini-FAQ I see posted on the c.s.a newsgroups. The feedback in itself is a gold mine, as it will allow more updates and so on. A server with nothing but source code examples, documentation, that sort of thing, like what Tony Greenwood has on STOS, would be good. That is what this and the programmer newsgroup is all about.

This is just the kind of thing I would like to try assisting in, though I may not be able to provide the space.

I understand putting the -- into the signature is one's own decision. So
it's probably better to not do it automatically, as everybody can easily
put it into the signature file.

I occasionly remove the -- from my signature in the posting if I refer to
the signature in the message, to make sure nobody wants to follow the
reference to an already cut away footer.

Your reaction looks most immature to me ... :-(

You're not seen on Usenet (Atari part at least) very often. In these times,
it's not a too wrong conclusion to come up with, that the author simply isn't
available anymore. True, you've been on the thread earlier, but I for instance
simply did not remember immediately that you're 1st Guide's author.

But maybe it's your kind of reaction that makes people starting to patch
instead of contacting the author. I'm not sure if I'd contact you if I knew
in advance that I'll get "welcomed" with such wording.

Cheers Peter

PS.: Derryck and Terry, please check this strange "Net2Net" newsreader you're
using if it got an option to include reference lines into new messages.
Without those, following the thread is VERY awkward.

From: greg_evans@delphi.com
Message-ID: <5nenVa8.greg_evans@delphi.com>
Source record: 108340

Peter,

Well STinG is no longer working for me.

But as for your point about saving the active port, if I don't
save that, don't I have to set that each time I boot the computer
and want to use STinG? Not much difference between having to
toggle it active there and in the STinG internals CPX then.

As I started saying though, STinG stopped working. The problem
is it tries to send the ATZ command and just stops there, no
timeout and response from the modem. I can cancel with esc but
it will sit there for as long as I want if I don't. I have a Falcon
and have set every reference to ports to Modem 2. The only place
I can't change that is the routing table which says Modem 1.
If I dial out with some other software, I can sometimes coax
STinG to dial also, but even that's not working tonight.
What's going on?

Greg

Well, that's unfortunate, because it wasn't shipped with all Falcons.
Apparently it wasn't shipped with C-Lab Falcons, or at least not mine.
Does anyone know of a really good non-commercial multi-tasking set-up?
I've tried spending what seemed like hours on end downloading Mint
distribution kits, only to either have the instructions in German (which I
can't read well enough) or the Set-up and Install programs crash when I
run them. I've tried just downloading a recent version of Mint, and
editting the config files per instructions to run Xaaes (the only
Multi-tasking AES I can find) and it freezes up and won't do anything. All
I want is a VERY basic M-tasking set-up. No MintNet, no extra add-ons, no
Unix-ported software, just the ability to run more than one TOS/GEM
program at a time. Does anyone have any suggestions? Thanks!

Mike Freeman

> It does set up this cookie correctly. If you doubt it, simply check the
> cookie.

Well, Andreas did say himself that MagiC creates the cookie but uses
another hidden buffer. This is atleast how _we_ thought it worked after
having discussed the problem with Andreas. If we are wrong he better
tell us, insteed of asking for proof.

To complicate it even more, I'm only the middle hand in this as I'm
not the programmer of the driver for the AB040. I'm just trying to
clear things up here.

> > used a buffer of its own and deosn't use the cookie, even though it
>
> Of course MagiC doesn't use this buffer. It's meant to be used by hard
> disk drivers, not by the operating system.

So when does HD-Driver use this buffer on a Falcon with Fast-RAM? I
guess you have understod that the problem is that we get data corruption
on the AB040 under MagiC. Under TOS it works by marking the FRB buffer
as none cacheable, but not under MagiC.

In which circumstances does HD-Driver use this FRB buffer on the AB040?
Always?

This is starting to be realy confusing. :-)

Solution 1:
Format a 720K DSDD disk on the PC,
Launch Cubase,
Load your song,
Insert your PC disk,
Select File->Save and Export to Midi,
Save it to your PC disk,
Stick your PC disk into the PC,
Double click on your MID file.

Cheers,

Nick.

No, and I don't see why it would be.

I've never seen a commercial programs go 'shareware'. Sometimes, the authors/editors agree to let go the rights, therefore it practically becomes freeware, but this doesn't seem to be the case here.

>If so, where can I download it from?

Nowhere. I guess you need to get hold of a 2nd hand copy.

I'm not sure what you mean by "RESET" button. Do you mean that actual reset button on the back of your machine? If so, I only use that in emergencies; I prefer to use Alt-Ctrl-Del.

What I was referring to in my post, was that I've always been able to click on a link while a page was downloading, and the current page would stop and CAB would start loading the new link. (Sometimes, it only aborts the current page, though, and a second click is required to move to the new link.)

:
: What was wrong?

So, ich bin jetzt das Englisch leid:

Auf dem TT wird immer, auch wenn er kein TT-RAM hat, ein FRB-Cookie
und ein FRB angelegt.
Bekanntlich verwendet die Floppy das ACSI-DMA. Bei jedem (!) Zugriff
auf das TT-RAM wird der FRB verwendet. Sonst nicht.

Problematisch sind Rechner, bei denen der FRB nicht beim Booten
angelegt wird, z.B. bei einem ST. Wenn dann ein Maddalt() kommt, wird
der FRB extra angelegt. Das habe ich f�r irgendeine der omin�sen
Beschleunigerkarten eingebaut. Nun kam neulich jemand mit irgendeiner
anderen Beschleunigerkarte und sagt, da� genau das Probleme macht und
da� MagiC selbst keinen FRB anlegen soll. Daher bin ich diese
unselige Diskussion ziemlich leid.
Ein ganz anderes Problem ist angeblich, da� MagiC bei Maddalt
zwar einen FRB anlegt (mu� es ja wg. der Floppy!), aber keinen
Cookie eintr�gt. Das ist ein echtes Manko.
Aber: Das Cache-Inkonsistenz-Problem l��t sich nat�rlich nicht
dadurch beheben, da� man den FRB nicht-cache-f�hig macht. Denn der
FRB wird nicht f�rs ST-RAM verwendet. Jedenfalls nicht von der Floppy.

Also ist die ganze Diskussion v�llig m��ig und nutzlos. Es gibt
zuviele Kombinationen von Rechner-CPU-Plattentreiber-Beschleunigerkarte-
RAM-Karte, als da� ich noch durchblicke.

It's contianed in Son of RFC 1036, the actually synatax is
<CRLF>-- <CRLF> but you seem to be using that anyway or my newsreader
(unlike many) doesn't care about the space. If you want a copy try
ftp.demon.co.uk/pub/doc/rfc/so1036.txt

> It was my understanding that all sigs should
> be prefixed with the above, that way programs can truncate any sigs or
> binaries etc. when you reply to an email/article.

It is IMHO a very good devic, it should be encouraged to make life
easier and to help stop idiots quoting sigs.

> I know Oasis2, Oasis1.3 (although it uses __ in error), and I'm guessing
> NOS all prefix the sig with this. NEWSie doesn't. Turnpike on the PC does.

Most moder software adopts it, it's not compulsory or anything but it's
the only standard we have so people have quickly taken to using it.

> POPwatch only acts this way when sending from NEWSie, because it has to
> append the signature to the end before sending email. All other POPwatch
> formats will be unaffected.
>
> Anybody got any ideas as to what is correct?

It is basically one of those things that just advised to make life
easier, I've no idea why anyone would actually dislike it enough to want
it removed, if you decide to go with this persons idea then I suggest
you just make the sig-sep an option which is set to on by default.

>I have been given a 520 ST. How can I upgrade it with more Ram,

This is done by using RAM expansion boards+SIMMs. The most well known are by Marpet and Frontier. You may find them second hand. If not The Upgrade Shop (01625-503448) does them. The possible upgrade steps are:

to Imb
to 2.5Mb
to 4Mb

a hard
>drive and find good soft for it?

You can use practically any SCSI HD connected to the DMA port via a 'host adapter'. The Link is the current one but you may find second-hand boards from ICD (AdSCSI) and Supra. You will, of course, need a power supply for the HD. You may be able to find a second-hand 'shoe-box' product - this contains host adapter, HD and PSU.

There is quite a bit of driver s/w which is PD. You could start with CBHD and then decide whether you want to pay for the very good commercial product, HDDriver.

There's loads of software for the Atari, ftp, www, BBS and shareware disc agencies. If you are on line try:

Let's get back to the original topic, which was not about clicking on
links while a page loads, or clicking on re-load (which is what I think he
previous poster meant when he said reset), although these are related. My
question is about the lack of multitasking during the "resolving host" and
"connecting to host" periods. I don't think this is a CAB.OVL issue
because this lack of multitasking during this specific part of the
internet connection process is also an issue with A-FTP, so I think it is
a STiNG thing. But why can't STiNG resolve the host in the background?

Indeed, there is a new version of Family Tree. It should be soon on
ftp.lip6.fr, as well as on Umich. The version will be released in French
as well.

The main feature of the new version is 3D look, as well as printing
enhancements.

I used to have that problem with my old server. I would try to download something
and 1/2 was through it would disconnect. Now that I've found a better provider
It doesn't happen anymore.

As far as unknown error 3. I found I have to top Appline and terminate CAB to
get control of my Falcon agian. Which means I don't have to reboot but I do
fragment some of my ram.

2324. F030 real-time clock failure

Newsgroup: comp.sys.atari.st
Date: 1998-02-03 00:00:00 UTC
From: gidds@cix.co.uk
Message-ID: <6b84fc$9md$1@chlorine.compulink.co.uk>
Source record: 108419

Greetings.

Yet another plea for assistance, I'm afraid. The real-time clock in my Falcon seems to have packed up - every time I switch it on it thinks it's 31:63:62 on the 31/15/2107!!! It also resets sometimes whilst the machine is turned on (when programs end, it seems). Infuriating!

My instinct is that the battery's dead, but I'd have thought then the clock would run fine whilst the machine is running. No-one I've spoken to seems sure about this. Has anyone seen this before? Is it definitely the hardware? (Should I be using anything other than the COPS or XCONTROL to reset the clock?) Someone pointed me to the NVRAM, but all the settings such as monitor type have been fine all the time. Is the NVRAM in the same chip as the clock? Is it a chip I need to replace?

Also, the doc for a clock program hinted that there're two system clocks - the keyboard clock and the GEMDOS clock? I know I'm easily confused, but this really puzzled me! Which one should I be setting? Which one of these keeps its time when the machine's off, or is it something else? If so, how do I ensure that when I set the clock, the new time is kept `permanently'?

I've even tried going back to the Forget-me-Clock II real-time clock cartidge I used with my STE, but although the config program is reading it fine, it won't set the Falcon's clock... :(

Help please!

(By mail, please - my phone bill won't allow me to check newsgroups very often :( )

Thanks,

_

I did have to replace the floppy in my falcon and tried using the standard teac mechanism you can get at Best Buy. I couldn't get the Falcon to use it, so I ordered one from Toad. They sent the EXACT SAME model; I put it in and it worked immediately. I still have no idea why the first mechanism I tried didn't work. There were no jumpers to adjust on either one.

Roger,

I didn't noticed that "Pissibly" typo until I just read my own message. I guess there may have been something Freudian there!

JUst checked the SERAL.CPX and it's set to Modem 2. My only other choice is LAN anyway. I did get STinG to work again last night but only _after_ I had dialed out with Flash first. I tested this several times to make sure and reproduced it every time. If I try to dial out with STinG first, there's no response from the modem or dialer. If I connect with Flash then go back to STinG everything works fine. I rebooted after each test to make sure. Strange!

Randy,

I have been doing a lot of reading lately so that I could add the
ability to load .mid files into Proscore, my shareware scoring
package (http//www.pressenter.com~tkelly). It will probably be a
while yet before I have a usable import function, but I found a
program by Piet van Oostram that converts midi files into text files.
You can read them, edit them and then convert them back into midi
files. I found it through the midi links on the Atari page
of Halvart Tangeras' (sic) web sight.

I think there are also a few sequencers available in the public
domain that might do what you want.

This is the first time I've heard of this problem. But that's
probably because I haven't done much offline news lately.

Thanks for the analysis. I will try to find why the '3-byte'
situation is occurring on offline news only.

I'm just passing through, but I dropped in to take a peek. I had an early 520ST with TOS in ROM (purchased December 1985) and the answer is yes, the two Boot ROMS could be replaced with a full chipset - the TOS in RAM (the tos.img file) used up so much RAM that it was a wonder that the earliest programs could work. Then again, the ST was so superior to the Skinny Mac (128k!) it wasn't funny. Once I got the ROMs installed, it was great! (and it was a great machine even without 'em.) I remember the 520 wasn't designed for a RAM upgrade either, but EZ-RAM got me up to 1024K. Which I really needed when I got into DTP.

> regarding compatibility, faster than multitos yes, nicer, better
> options yes BUT NOT SERIOUS for everyday use.

Hmm, I did say that those are even more incomplete, but far less buggy,
didn't I ? So certainly in terms of bugs both are a lot better, and it's
that what I was talking about.

Whether they are serious for everyday use has everybody to decide on his
own. I used XaAES for a little while, but true, I changed too, eventually.

> In this case, the old multitos would be better. YOu run MUCH more
> program(old included) in multitos than Xaaes+oAesis combined.

Applikations, yes; system tools, no.

>>> I'm quite happy for now to use Stik with Mint but I would like to go
>>> back to Sting in the future (to use PPP)
> I am puzzled, if you have mint installed, why don't you just install
> mintnet???? a lot of people don't want to use mintnet because it
> requires mint, but you already have mint.

Maybe because he doesn't like a Unix-like environment, which is required
by the tools ? I too was annoyed when I found I HAD to create a etc
directory, etc to make MiNTnet work. Only solution had been to dig in the
source code, and recompile. I never did it because gcc was needed, which
I did not want to install at the time. See where this leads to ? One
program, if you seriously want to exploit it's capabilities, needs others,
those requiring others again. It's natural if you've worked on Unix for
a while, but Atari / GEM went a different path. MiNTnet is not very
useful if one wants to pursue the latter.

So even though MiNTnet is certainly a very nice thing, there are enough
reasons to choose something else. Some people are simply afraid of setting
it up, which is far from easy if you've never seen before how Unix does
certain things.

> compatible, Just the best. Once again, do NOT recommend Xaes NOR
> oAesis as replacement to multitos.

I'd never be so presumptuous to recommend to use ANY program. This would
mean telling the people that my judgement were always the right one. What
I do recommend is people should TRY XaAES and oAESis, and then make their

own judgement. This is always a good thing to do, especially as both AESs are free. I simply assume people are mature enough (dunno what you do) to decide on their own if they want to use the thing I've talked about, after they've tried it.

How comes that you know XaAES so well ? Wasn't there someone recommending it to you (to check it out (!)) ?

As you seem to have established some communication, can you please ask
him what precisely does he want ? We're right in the process of discussing
extensions to the STiK API, so this is the right time to get his input.

> Jupp it's a problem. Another problem which we have already talked about

What do you call a standard ? MiNTnet is BSD socket compatible, and I
hope it won't take to much time until I can finish the BSD layer for
STinG that I'm working on.

> Wensuite, and now this!

Very true. There is only one way out of that : Everybody should send him
some mail saying that a version using an existing TCP/IP (MiNTnet or STinG
IMHO) stack would be most appreciated, with some detailed explanation,
what can be done (what variety of clients exist) with them, but can't with
the Draconis stack. I keep doing that from time to time for Wen.Suite,
and hope there are others doing the same. Lamenting here does not help, as
neither the Adamas' nor the Wen.Suite's authors are reading here.

Only lobbying can achieve this goal.

You're only guessing from the time of the last update ? That's quite
silly, isn't it ? You obviously have never talked to the author,
because he'd told you that he's got a HSMODA08 in the works.

Harun's opinion all the time simply was that no update was required.
Should he post the same HSMODA07 as HSMODA08, so that you do not think
it's unsupported ? Still people would mail him that V8 doesn't work
even though V7 does ... ;-)

> sending mail, all are being done with few problems.

Strange thing, as you say only FTP is effected. Is the FTP download speed
alright ? Check the Dialer's Statistics tool, do you have many dropped
packets at either "TCP" or "Modem 2" ?

If you have access to the proper versions of the files (i.e. by downloading
them some other way), do a byte by byte compare. Are the errors localized
(at the end or beginning of the file), or spread about the file ?

They shouldn't. Only the application (i.e. CAB here) should be frozen. You
should be able to launch other programs etc. and play with them.

If this is not true, one should ask Dan Wilga why he didn't inplement the
$c9 opcode into Geneva's trap#2 handler ... ;-)

> This is particularly frustrating because the built-in countdown periods

Your ISP's name server should get back almost immediately if the domain name
in the URL does not exist. Try the Dialer's resolve tool.

I actually doubt that this will work, i.e. prevent the hd from getting
trashed. NEWSie certainly does not trash it by file handling calls, but
by accidentally overwriting GEMDOS internal structures. This will happen
regardless if NEWSie resides on hd or a RAMdisk, and will then trash the
hd again, as it were pure luck if only those structures regarding the
RAMdisk were effected.

I'm pretty sure I used to have the Link plugged into my Zip and the Zip
connected to my HD, I know the link doesn't supply termpower but your HD
should and it's a chain...

> Is there a simple way of providing termpower to the Link without

With my Zip from HiSoft they provided a cable from the Joystick port to
one of the ports on the Zip, it would probably involve a bit of
souldering but only to wires and plugs...

Umm, I was looking at an advertisement today, and the drive that
looked simular to what your talking about connects to an IDE port
(but it said that it reads floppys too).
If it is one in the same, it looks to be to PC Bastardized to work on
an Atari (even on the Falcon IDE). Still, IMHO, the Syquest EZ 135's
are a very good device on any Atari. You can even use the IDE version
on the Falcon (with the right cable). Refurbished units usually go for
about $75.00, and their fast.
Maybe were not talking about the same device.

Mike

No response at all? Harun actually encourages emails in the doc files, and actually encourages you to send in updates and that kind of thing. Has anyone even gotten a response out of Harun?

Also while doing some more websurfing, I came across a BBS program called JoyBBS, that was updated to ANSI C by this one author. I'm hoping I can get something from him on this serial programming thing. I don't have the URL handy with me, though you should be able to find this.

>Started about a year or more ago By Richard Tiejns (sorry probably bad
>spello) and sort of moderated by him, I have posted the odd binary to
>it and downloaded the odd file,

It's Richard Tietjens. I've not seen him on here in awhile, either, unless he's frequenting other newsgroups, like the news.admin.net-abuse.* newsgroups that I occasionally read. alt.binaries.atari and alt.binaries.atari.d both still exist on my provider's server, and I have yet to see anything in the control group mentioning an rmgroup of them.

>Only the obvious, It may not be avialable to all newsfeeds, but it
>does exist :)

A booster could definitely help, but will more propagation help? Will everyone use it? Is it a moderated group? What do we need to know?

James.

The St will read the data from the the Pc as is if this driver was downloaded from the net. Copy the data from your hard drive onto a 720K PC Dos formatted disk. It should work fine. The Atari (unless you've upgraded to an HD Floppy) will not read a 1.44 meg dos floppy but will read a 720K 2DD disk.

Terry,

Using my TT and CAB 2.0 I could not get the system to reset before I started using CAB.OVL 1.2805. In fact for some time, covering a few versions of the OVL, the "RESET" button stopped working altogether. Other combinations of CAB/CAB.OVL may very well produce different results :)

2360. Falcon Floppy drive

Newsgroup: comp.sys.atari.st
Date: 1998-02-03 00:00:00 UTC
From: J Wilkinson <jwandjw@ihug.co.nz>
Message-ID: <34D6B827.4CE@ihug.co.nz>
Source record: 108466

Hi there,

My Falcons floppy drive has gone kaput. I wish to replace it (obviously!), but need to know a couple of things before I go and buy one...

1. Will ANY 1.44MB floppy disk drive work with the floppy controller chip in the Falcon?
2. Do ALL floppy drives have the correct mounting points (3 or 4 holes in bottom of drive chassis) for me to simply replace the drive without doing ANY kind of surgery?

Please don't reply to the source address or the group. The source address isn't mine so I won't receive it myself. Replies to <chris.wilkinson@customwood.co.nz> please. Sorry 'bout this but I don't have access to newsgroups at all normally! ;^\

Finally, I've been absent from the Atari 'net world for quite some time and would gladly welcome any news of anything thats been happening in the Atari world. Feel free to email the net address above with any snippets you may have!!

Cheers,

Chris Wilkinson.

Well, that sort of program is called a sequencer. I'm not aware of any
sequencers that do scoring except for Cubase or Notator/Logic, which you
will have to find on the 2nd hand market.

Hi,

>Hi!
>I have an Atari TT030 and I will soon have an 1040 STe.
>Is there a way to network the two together, so I can
>access applications from the TT hardrive with the STe?

>Atarian
>Tim Conrardy

There are a few utilities around that will allow your STE
and TT to share drives and printers. The simplest on to
use is DUET. Duet will allow two Atari's to share drives
and a printer over either the MIDI, Serial or LAN ports.
DUET is easy to setup, but I have found that it does not
work with MiNT or Magic.

You will find Duet on most Atari FTP sites.

Regards,

Ben Hills.

Yes, it possibly will work, but can I use some other programs (e.g Newsie,
CAB etc.) in this case? Because I should log in as user 'ppp' with the
terminal emulator and after I've logged in this way, I'm not sure if other
programs are able to communicate thru the serial port using the
point-to-point protocol.
That's why I thought maybe modifying the login part of DIAL.SCR in STinG
would help... (?), 'cos (if I'm not wrong) STiNG with a modem is actually
a network interface between my ATari and the Internet, isn't it?
Of course, I'll try callback with CoNnect, and let you now the result.
Thanx for the answer and cheers,
Rob

Well, this is not correct, as far as I know.

> > So does anyone know how to get hold of this FRB buffer under MagiC so
> > that it can be set to none-cacheable? We have tried to get some info,
>
> Obviously you didn't read the official information about the FRB,
> documented by Atari and literature like the Profibuch or Atari
> Compendium.

It's not me who is the brain behind this, I'm just the middle hand, but
I know
what the _FRB cookie is for.

The facts also are that MagiC doesn't use the _FRB cookie like it
should.
This is from what Andreas have said him self, or he was misstaken or
MagiC
has changed recently. Andreas said him self that MagiC creates the _FRB
cookie, but it doesn't use it. It uses another buffer not accessible
from
the outside world. This has Andreas told us him self. If it's wrong or
has
changed he should say so.

Maybe it has been a missunderstanding, but it's obvious that something
is
wrong here. Andreas says one thing and you says another. Also the facts
is that MagiC does not behave in the same way as TOS regarding this as

under TOS it works to mark the FRB buffer as none cacheable but under
MagiC it doesn't. That's just how things are.

I would appreciate it if this could be cleared up so we know what needs
to
be done. As it's now, it looks like noone realy knows what is going on.
This is atleast my impression from this.

No? So how is it then???

Also, how does MagiC treat the FRB buffer and how sets it up the _FRB
cookie?

The correct string is <CRLF>-- <CRLF>, that is <dash><dash><SPACE>.

Maybe you can just add this manually to your sig file, so that whatever your newsreader inserts, at least your sig will not be quoted, which is the main purpose of all this after all.

Cheers,

Nick.

There are some 1040STEs where you don't need to solder the 2 jumpers. They are produced in 1989 and contain Eproms instead of ROMs.

Tschuess,
Frank

It does set up this cookie correctly. If you doubt it, simply check the
cookie.

> used a buffer of its own and deosn't use the cookie, even though it

Of course MagiC doesn't use this buffer. It's meant to be used by hard
disk drivers, not by the operating system.

Good question, I know about ST drives, but does the Drive ID and media change stuff also apply to Falcons.

>2. Do ALL floppy drives have the correct mounting points
> (3 or 4 holes in bottom of drive chassis) for me to
> simply replace the drive without doing ANY kind of

I guess the holes are more or less standard, since just about any PC drive should go into just about any PC. If the holes are the same as on an ST, then any TEAC or Sony drive should work. I have been told that Fujitsu drive didn't fit, but I have one in my ST, and it fits fine.

>Anyone have any ideas on this phenominon?

It's funny that it should all be happening at the same time.

The drives are not coming up to speed in the time the controller
allows. This is either because:

The power supply is failing to deliver enough current.
OR
The drive bearings are worn and are preventing the drives coming up to
speed.

If it's the second you should be getting interesting grinding noises
from the drives :-(

Is that still updated ? If so, does it include STiNG or STiK ?

Maybe someone could compile a WWW package that you could simply decompress to
a floppy and boot. You should only have login/password, and phone number
parameters to get it to work. That would be a simple move to turn any
lowly 1040ST into a netbox.

Judging from the questions in here, there seems to be demand for a simple
unique web access package for floppy driven STs.

I suppose you would need authorization from STiNG and CAB authors.

Any volunteers ?

Cheers,

Nick.

Hallavart has a file on his server that explains how to connect a PC floppy to an Atari. I don't remember the make, but I'm sure he'll see this and reply. If he dosen't, there are many links to his web page around. He has been posting in C.S.A.A recently so you should be able to find his site there.

Any chance that there could be a version of MPEGDSP which supports video
cards? I guess it should work on the Hades with that DSP/Sounds card if
it wasn't for the video mode. It doesn't work on Nova cards either.

> MPEGDSP only displays I-frames and skips P- and B-frames, because

>Thanks a lot
>

I don't know if GFA is quite the same as Microsoft but you could try the
following

lprint chr$(X);
where X is the number containing the bits set to your values, eg. sending
chr$(9) will set bits 1 & 5. The ; stops Microsoft basic from sending a carriage
return (chr$(13))

hope this helps

2390. Kick Off II!

Newsgroup: comp.sys.atari.st
Date: 1998-02-04 00:00:00 UTC
From: ctg100@york.ac.uk
Message-ID: <6b9uva$87n$1@pump1.york.ac.uk>
Source record: 108294

Just a little post to say that if anyone remembers (or still plays) the World's greatest ever game, Kick Off II, the KICK OFF II webpage can bring back all those happy memories...

http://www.york.ac.uk/~ctg100

Cheers,

Chris.

2391. FS: TT high res 21 inch EIZO monitor

Newsgroup: comp.sys.atari.st
Date: 1998-02-04 00:00:00 UTC
From: "Dr Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <6b9vsk$5if$1@loki.cf.ac.uk>

Hi there,

Well I just wonder if anyone have tried to type in the url:

http://www.atari.de

Try it. :-)

: So you consider a MacIntosh more "alternative" than an AGA Amiga ? Rather
: interesting notion IMHO ;-)

In the demo scene, AGA Amigas are faaaaar more mainstream than Macintoshes.
Like mentioned, I've never seen a Macintosh demo ever although I guess
somebody must have created some.
In fact I've never even seen a Macintosh at any party

>jumpers to adjust on either one.

There surely are - at least on current TEAC FD235 drives, there is a 0Ohms
SMD resistor to select DS0/DS1. The drives are shipped with DS1 (which is
used on PCs). If you change that to DS0, the drives works fine on a falcon.

On other drive types, you might have to cut a trace and connect a wire so
that the drive responds to DS0.

cu

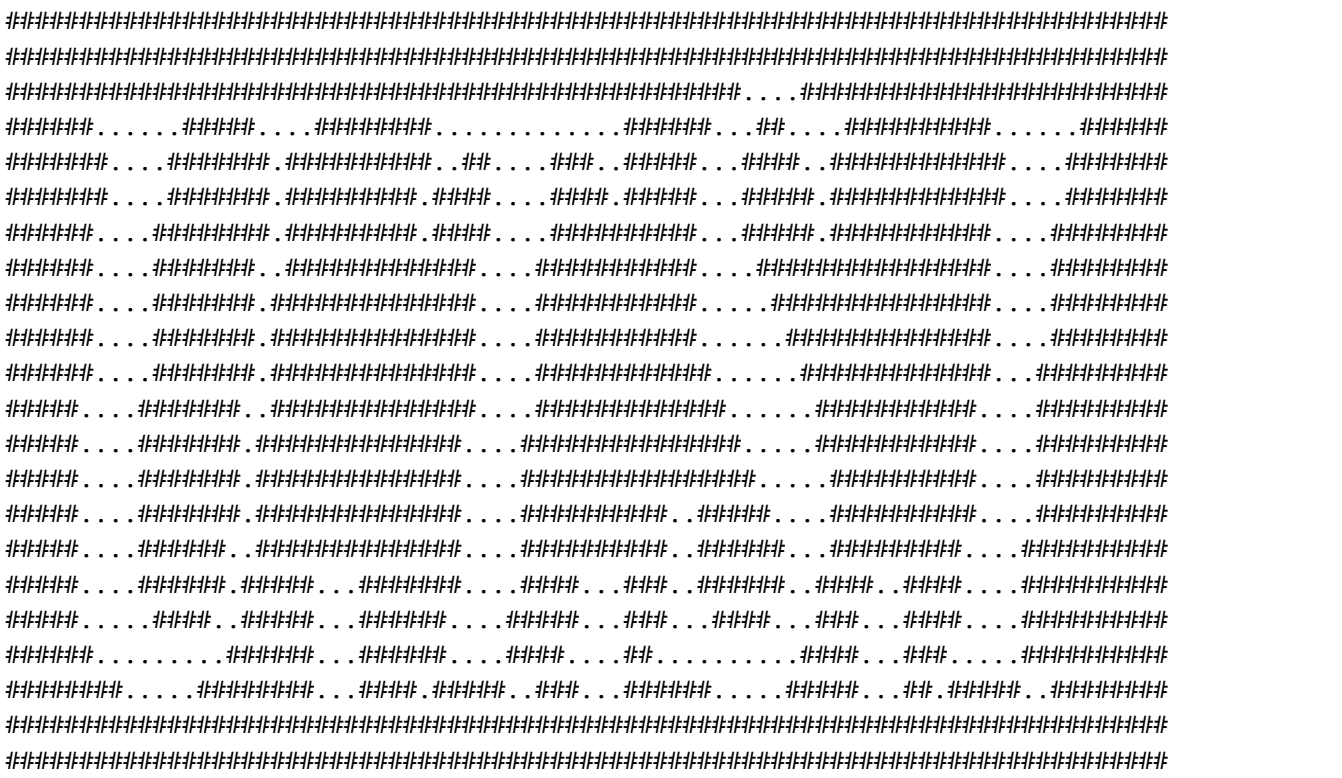
>
>The latest version I have is from April 1995 v1.12. Docs are in both English
>and German.

I have the 1.08 version and I will be happy if you could send me the
newer one by email :)
Also, I have been able to create a new
32000/65000 colors resolution with the help of Dan Wilga, but the only
problem is I can get a 320*480 resolution and when I edit the screen
widht to 640, my monitor don't show anything more ...
So I believe I cannot handle very well the parameters of VMG4000 and I
don't know which parameter to edit to obtain a reasonnable resolution
.. I guess just a little thing is missing but what ?
If someone had an already done NVDIVGA.INF file I wish they send it to
me to avoid to make some errors while handling the resolution editor
..
Nevertheless thanks for your advice Harry.

Jo

2396. [WEB] U.T.S.I UPDATE ... again

Newsgroup: comp.sys.atari.st
Date: 1998-02-04 00:00:00 UTC
From: dipching@ping.be
Message-ID: <6ba5tedbb4@news3.Belgium.EU.net>
Source record: 108300



Hello everyone, you can now find about 660 atari programs url links in
the U.T.S.I ...

A new page has been created and can be accessed from the main U.T.S.I
page ... it's called GRAPHIC LINKS page and is just about showing the
main atari companies (resellers, developers and so on) with graphical
links ... you'll find there the companies logos ...

Note it exist only one place (for the moment ...) from where you can
access this new page ... it's at PRG-IND2.HTM

Also thanks to everyone who is participating at the UTSI when sending
their remarks, found wrong links, contribution and so ...
THANK YOU very much for all these friendly people who are ALSO
maintaining the U.T.S.I

Jo Vandeweghe

Hi Peter

I DL'd FSER096B.LZH from nic.funet.fi for info on GAL, but my german is not very good. Would I use F_SER in place of HSMODEM? Or is GAL a hardware modification?

I retrieved this file with no errors (!). The Dialers Statistic tool reported 17 dropped packets at TCP and none at Modem 2.

How do I do a byte by byte comparison of files? When I unzip a corrupted file, the errors appear throughout the file as it is unpacking. Some parts are intact (usually text files) some are corrupted (usually binary files).

The size of FSER096.LZH is about 57k. Maybe only large files (>200k) get messed up.

Ross MacIver

The complete and demo version are different. There is no key to put
somewhere to disable the demo restrictions.

>get it to FORMAT to this higher capacity on HD floppies itself. Is it
>possible to do?
>What don't I know that I should? (Be kind!).
If you can read/write HD floppies on your MegaSTE, this means that apparently,
your hardware is OK for that, i.e. that the original MegaSTE was modified
accordingly.
All you have to do then, is to open the hard disk case on the right and locate
a small red DIP switch block. Set switch number 7 (assuming a numbering from 1 to 8),
it is the second one to the right. After you reboot, the option FORMAT in menu FILE
on the desktop will show a new option HIGH DENSITY.
That's all...

Cheers.

> your HD should and it's a chain...

Cool - I wasn't sure if termpower was applied to the SCSI bus as a
whole. At least it's something else to try! :)
(The terminator I ordered hasn't arrived yet)

> With my Zip from HiSoft they provided a cable from the Joystick port
> to one of the ports on the Zip, it would probably involve a bit of
> souldering but only to wires and plugs...

I may see if I can get one of these, as it would be nice to use the
Zip without having to power up my other drive (if I can sort the
cabling out - that damn mandatory autodetect cable is a nuisance...)

Thanks Paul...

>Is IMAP a true standard ? If so, which RFC to look up ?

hmm a true standard? you have to define what a true standard is, not
even POP3 is standard, (look at demon.uk pop3 server ;)

Yes, it is a standrd, and MUCH better than pop3, in many areas, but
since not ALL provider have imapd installed, well you see the problem.

As for the RFCs, yes, there you go.
RFC: 2062, 2095, 2060, 2061, 2086, 2087, 2088, 2177.

2410. Re: Falcon Floppy drive

Newsgroup: comp.sys.atari.st
Date: 1998-02-04 00:00:00 UTC
From: james.burr@acpu.com
Message-ID: <886610478@acpu.com>
Source record: 108314

-> >Well, I know that, but I'm not sure about any Falcon specific details.

I am! I happen to have the ATARI FALCON030 Service Guide - Part Number CO303062-001 released October 1, 1992.

-> I did have to replace the floppy in my falcon and tried using the
-> standard teac mechanism you can get at Best Buy. I couldn't get the
-> Falcon to use it, so I ordered one from Toad. They sent the EXACT
-> SAME model; I put it in and it worked immediately. I still have no
-> idea why the first mechanism I tried didn't work. There were no
-> jumpers to adjust on either one.

Well, I have had quite some experience working with Ataris and their floppy drives for I successfully was able to upgrade a 520 STFM to use a TEAC 235HFN 1.44 MByte drive using TOS 1.4 (would have also worked with TOS 1.0 if I used the NEODESK 4 control panal).

Here's the scoop with high density ATARI floppy drives. Most if not all PCs that use floppy drives have the density select (a mechanism either hardware or software driven that determines if the inserted disk is high density or low, double density) driven by the Operating System which I think is inadequate and barbaric at times. The Ataris density select is is hardware driven. The high density floppies when campared to a double density floppy has an extra hole on the left side that the floppy drive sees and thus sets the output signal on pin 2 of the drive to high (5 volts) to tell the computer's hardware that a high density disk is inserted. The OS of a PC determines if the disk inserted if high density by scanning the format of the disk. That's why it has a slight delay after you put the disk in before it does anything to it. Most manufacturers of floppy drives recognize that as standard and quit making drives that output density select on pin 2. The AJAX chip and TOS (2.0 or above usually) rely on the drive to output density select on pin 2 to determine what disk format is used.

After I learned of this I quickly discovered how to make my TEAC output a signal to pin 2 by adding a jumper to it and SUCCESS!!

I needed to upgrade my ST to high density so I can use DOS 7.0 with the AT-Speed I had installed.

Later,
James

*** MUST SELL THESE MAGAZINES TO GOOD HOME! SEE BELOW! ***

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly. Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President trevor@cyberspc.mb.ca

Yes, there is... fï¿½r jedermann! The Atari community.
Install XLATOR with the GER_ENG.DIC and join the Atari world of today.
<grin>

I think this is very serious and it could grow to be our common meetingplace. I know, Magnus that you and I live in the same city, we haven't met yet, maybe this community is the right place?

Take a look at the HTML-script for the main page. The webpages is made by Mr A. Goukassian himself (Chief of staff, ST Computer - Falke).
Coded with Netscape, hmmm... Falke have the number one Atari HTML-editor product, Homepage Penguin Pro. o.k it costs 39DM, but. Maybe I have to ask the man myself, I'm going to make a three-day trip to Kiel next week and planning to visit Falke.

They (Falke) are planning to implement a HTML Atari Chatroom at atari.de and they invite companies as well as "jedermann" to hook up as sub-domains to "as your subject says" the Atari moved to Germany.

I have a complete Atari 520 ST system and an Amiga 1000 system for sale. The atari was purchased in 1985 and subsequently upgraded to 2.5 Mb. Everything works. I just tested it all. There is a box of diskettes with a variety
of software for each system as well. I also have a variety of software that will go with each system .. some games, a Forth programming system, etc, etc. I even have the original boxes for everything. I want to get rid of it all but don't
want to be left with pieces if I can avoid it... OTOH I can flexible. BTW the Amiga works fine as well. No hard drive but it has 1.5 Mb of memory there is also a bunch of software for that and the original boxes and manuals. These things are really museum pieces and have been taken care of as such.

Make an offer by emailing me at tensfeldt@worldnet.att.net or ttensfeldt@compuserve.com.

Hi all,

Has anybody received any posts from me on this thread since the end
of January?

I can't see any that I've posted coming back from my ISP

This keeps happening to me : I experiment with Mint and comms and end
up messing up my setup. After one session with Stik/Mint I
re-received a lot of posts I had already read
Another time I logged on to find I had a negative number of posts
waiting !?!?

Is anybody out there?

Cheers! Simon :-\

hello, my name is forrest and i am having to learn the atari os. i have two computer systems that need to be set up for music and audio applications but i have no manuals and was wondering where to begin to learn this. does atari offer any kind of support still, or is atari even in the biz anymore? the one system that i have working right now is, i think an st 40. the os seems a bit mac like with the gui. i have found where you set monitor resolutions and low and medium are greyed out only high is availible thus all my icons are tiny. i figured this box had one hard drive, but when booted i see a and b floppy and c, d, e and f drives. is it partitioned? i have also hooked up this external atari hard drive which sounds and looks like it works, but after booted i don't see any new icon for it. if you know where i can find some tutorial type of info on operating the atari os i would apperciate it greatly. i am glad to say that the cubase score seqencer version 2.x does work so i am not completly at a loss. many thanks in advance, forrest.

Yes, that's true. Unforyunately, the registered programs and
shareware versions are not the same. The program has to be modified
in someway to be fully operational. Maybe the author was afraid
someone would crack the code.

No, you get a *.STG file which is a source file that can be fed again into
the compiler to remake the *.HYP. The *.STG is the plain text, together with
some formatting "commands". There is another tool in the ST-Guide distribution
that filters out those commands, leaving the plain text.

Sure I could make a printed version of the docs, but unfortunately I never
figured out how to upload paper ... ;-)

What do you want to know ? If you're after programming serial traffic for
some application, I have three important hints for you :

- Use GEMDOS file handling functions for doing it.

- Do not access the serial port via BIOS, but use GEMDOS file calls.

- Do not use the GEMDOS Caux* functions, but GEMDOS file functions.

If you follow these, you'll find programming serial ports is easy, and fun.

It does, in a sense. Only the application that does the resolve is blocked.
This is inevitable as this application will need the IP address to go on.

There is no way for the application to do the resolve truely in the background,
except using MagiC's threading features. This is dictated by the way the STiK
API works. It's a limitation, but not a very bad one IMHO.

2428. Calamus SL English Upgrade

Newsgroup: comp.sys.atari.st
Date: 1998-02-04 00:00:00 UTC
From: pmorales@primenet.com
Message-ID: <6bbbk1$t94@nntp02.primenet.com>
Source record: 108332

I received the following in answer to my inquiry regarding the English upgrade to Calamus SL, and thought I'd place it here for anyone else interested:

---------- Howard's reply follows --------------

Please feel free to post this reply anywhere that Atari (and Calamus SL) users happen to congregate.

The Calamus SL98 English upgrade is nearly ready. The master disks are being tested right now. That means we'll be shipping within an extremely short period of time. Early orders will be shipped first of course - we have quite a few Calamus loyalists waiting patiently and we deeply appreciate their patience.

The upgrade price for the new version is US$99 + plus shipping. Shipping costs vary depending on the method you prefer. Parcel post is the least expensive (about US$10-$15) and courier is the most expensive (up to US$25).

The upgrade is shipped with a 45 page addendum to the main manual. The addendum explains the new features in excellent detail, and will get regular users up and running with the new features in no time.

I apologize for the hesitant response from our MGI customer service people - they are valiant souls and good people, but there just isn't quite enough room for all the Atari/Calamus knowledge they need (in addition to all the PC knowledge they already have) to be genuinely effective about Calamus. Please contact me directly with orders and for any other kind of information or support.

Greetings Atari Users,

We have the following Atari 8-bit and Atari ST items for sale in the USA.
Every item is used original and is in good working condition.
Buyer pays for shipping.

ATARI 8-bit items
---

1. SpartaDos X Cartridge version 4.21 dated 7-10-89
No manual or box. Like new. Price-$25.00

2. SBM Small Business Management for Atari 8-bit Computers
Original disk, Notebook manual, Basic XL cartridge and manual.
Requires 2 Double Density Disk Drives. Price-$15.00

3. 11 Atari 8-bit software titles
MRCA Mach 2 / original disk and manual
Wayout / original disk and manual
Mad Magazine's Official Spy vs. Spy / original disk and manual
Asteroid Miners / original disk and manual
Round About / original disk and manual
Micro Shuttle / original disk and instruction card
Bill Budge PinBall Construction Set / original disk and manual
Raid over Moscow / original disk and manual
Menu Writer / original disk, manual and box
Cut and Paste / 2 original disks, manuals and folder box
Music Construction Set / original disk, manuals and folder box
All Eleven software items for $35.00

4. Omnitrend's Universe
2 Original disks and Large Black NoteBook manual
Hard to find game. Price-$30.00

5. Atari Remote Control Wireless JoySticks
Original Box, 2 JoySticks and Interface. No PowerSupply.
Intended for use with a 2600 system but will work on Atari 8bit.
Like new. Price-$10.00

6. Atari XDM121 Daisy Wheel Printer
Good condition. No manual or box. Prints well.
Price-$15.00

7. PQ The Party Quiz Game
4 push button controllers, Interface, 2 original game disks,
4 sets of extra game disks, Original manual and box
Hardly used. Price-$20.00

8. Animation Station
Drawing Pad and Pen, Original disk and manual
Like new. Price-$20.00

Atari ST Software
---
9. SuperCars II / Original Disk, manual and box
Price-$7.00

10. RamPart / Original Disk, manual and box
Price-$7.00

11. StormBall / Original Disk, manual and box
Price-$7.00

12. Tetra Quest / Original Disk, manual and box
Price-$7.00

13. Wanderer / Original Disk, manual, 3D glasses, and box
Price-$7.00

14. MindWheel / Original Disk and Book
Price-$7.00

15. Essex / Original Disk and Book
Price-$7.00

16. Total Recall / Original Disks, manual and box
Price-$7.00

17. Last Ninja 2 / Original Disks, manual and box
Price-$7.00

18. R.B.I. Two BaseBall / Original Disk, manual and box
Price-$8.00

19. Jewels of Darkness / Original Disk, manual and box
Price-$6.00

20. Damocles / Original Disk, manual and box
Price-$7.00

21. The Sentry / Original Disk, manual and box
Price-$6.00

22. Q-Ball / Original Disk, manual and folder box
Price-$7.00

23. Mortville Manor / Original Disks, manual and folder box
Price-$7.00

24. Into the Eagles Nest / Original Disk, manual and folder box
Price-$6.00

25. Cloud Kingdoms / Original disk, Poster instructions and box
Price-$7.00

26. Monster Pack Volume 1 (includes 3 games)
Shadow of the Beast 1
Infestation
Nitro
All original disks, manual covering all games, and box
Price-$10.00

27. Zork II / Original disk, manual, box, and etc.
Price-$6.00

28. Zork III / Original disk, manual, box, and etc.
Price-$6.00

29. Zork Trilogy / Original disk, manual, box, and etc.
Price-$9.00

30. Beyond Zork / Original disk, manual, box, and etc.
Price-$7.00

31. A Mind Forever Voyaging / Original disk, manual, box and etc.
Price-$7.00

32. WishBringer / Original disk, manual, box and etc.
Price-$7.00

33. SpellBreaker / Original disk, manual, box and etc.
Price-$8.00

If any one is interested in purchasing either all Atari 8-bit or Atari ST
items at once, then make us an offer.
Also we have alot of Used Original Atari 8-bit and Atari ST software that
is not on this list. So if you are looking for a item(s) that isn't listed
then just ask, we may have what you're looking for.

Thanks and contact us at the following address.

Me again,

Thanks everyone who helped with my HD problems... It seems ADHI just
cannot handle 2G HD. I tried the demo version of CBHD and HDDriver
to actually access the drive.

Anyway, the next thing I want to fix is the battery. The clock hasn't
been keeping time since I got it. I looked at the battery and it says
it's a 3.6V. I did a quick check at my local Radio Shack (OK , I admit
not the best store) and they didn't have the model of battery.

Does anyone know what the specs are for the TT battery. I have a few
places I want to shop downtown (Toronto). However, I have no idea how
many amps it should be. Or exactly what the connection is called other
than it has three holes.

Stephen,
If your battery is original it will be a black plastic object, square when you look at the end and a little longer than a AA batter with wires coming out the end. That's because there is a AA size battery inside. As you say, it is 3.6 volts, so it is not a standard AA battery. I believe it is a Lithium battery, if memory serves me. Anyway, carefully pop the cap of the end of that box where the wires exit and you will be able to remove it. Take this to a shop that specializes in batteries and they should either have it in stock or be able to source it for you. You'll find they recognize this far easier than they do the packaged unit. The battery shop I got mine from, here in Calgary even resoldered the wiring harness on to the new battery for me, and the price is far cheaper than you would pay for the fully packaged unit. Hope this helps you out.

Source record: 108343

Hi,

>1. Will ANY 1.44MB floppy disk drive work with the floppy
> controller chip in the Falcon?

Yes - but you'll have to turn the flat cable the "wrong" way around. You'll
also have to change the Drive Select to #0 instead of the default setting,
which is #1 (normally made with a small jumper or switch).
Another thing to keep in mind is that you probably won't be able to use
special formats (other than 720 or 1.44MB), since it seems like most
PC-drives can't handle them for some strange reason...
By the way - I've tested this without any problems with Sony and Teac
drives, but I believe that any brand will do - as long as you can change the
Drive Select.

>2. Do ALL floppy drives have the correct mounting points
> (3 or 4 holes in bottom of drive chassis) for me to
> simply replace the drive without doing ANY kind of
> surgery?

Plug-and-Pray...
The holes will fit, but the screws may be too thick. However, if you're
persistent enough you'll be able to use them anyway...
Since the hole in the Falcon's side was made for the right kind of drive,
you won't even have to cut anything out in the plastic either :)

Best regards,
Claes

I've noticed that as well, on the odd occassions I use Newsie for downloads.
If you leave it to timeout it should start with the next article, not that
I wait for it to timeout. Pressing ESC usually ends up with it starting to
collect from the next group, meaning I have to click 'read offline' another
time.

On 2 Feb 1998 00:10:04 GMT, "Kev" <kevj@clara.net> wrote:

>
>> What is a POP3 Server? The other's I think I understand.

It's one method of receiving your email. Ask your ISP for its "name"
and enter that in the appropriate box.

>Ummm, sounds familiar, can't tell you off hand though.

Post Office Protocol 3. Basically it's a wrapper for SMTP. Simple Mail
Transfer Protocol is what ISP's use to throw the emails around between
themselves. It is ideal for them because they are online constantly
and smtp is a listening thing - all an ISP need do is listen for
incoming mail. If none comes, carry on listening, otherwise process it
and figure out the best way to forward it one stage closer to the
destination.

If your software used smtp for receiving its email then it would have
to listen constantly for it and there is no way of telling if there is
any, or forcing the isp to send any if there is - you can only wait
until it feels like it. Worse, when you do get it, it'll all come at
the same time so your software has to be able to handle receipt of
simultaneous emails.

Much simpler is pop3. Your ISP bungs all your emails in one place, you
connect to the pop3 server which promptly tells you if you have any,
and what they are. And when it does send them, it's because your end
tells it to and it does so one email at a time so only a single
connection is needed.

[Bet you really didn't want to know that] ;-)

Gee Tony, I was just trying to avoid getting into yet another
wrangling match over STOS versus C - and there you go getting all
defensive! :-))

>whats that all about then ?

Simply trying to avoid implying the reverse which I seem to have
managed to do anyway. That certainly would have bought you out with
all guns blazing!!! ;-)))

It'll not be K&R if there's function prototypes or if function
definitions also have their types in the braces. ie

main(int argc, char *argv[]) <- definately ansi

main(argc,argv)
int argc;
char *argv[]; <- can't tell

>Is there any
>interest in getting Yelvinton back on here, even though it's been awhile?

The offer is good enough. <G>

After all, the space could be spread across different sites.

It should have been 2 in the first place. Unless I'm very much
mistaken C: always starts at 2, even if there's been bad sectors
written to the bad sector list on a format.

>D also became unreadable.
>On reestablishing the previously saved boot info (which I've had to do
>on other occasions), things got worse: the whole HD was unreadable ;-[[

You might have a deeper problem but unless there's a darn good reason
for C: starting at 10 instead of 2 then it probably isn't hardware.
[Help someone!]

>Nothing for it but to reformat,

I've only formatted twice - once when I got the hd yonks ago (then
discovered I needn't have 'cos it already was) and once when I
suspected I had a bad sector (then discovered I didn't).

>re-partition C to F, reinstall AHDI
>and whatever back-ups I have. Result: first boot was completely
>successful, with Harlekin and XControl OK; but XControl again does
>not load on subsequent boot ups (nor do COPS or ZControl).

Where does C start now? Has it moved again?

>sigh......

Can't remember with Xcontrol but Zcontrol will run as an app. Fire it
up manually under MagiC and you can at least get at your cpx's. Does
it behave itself this way?

[Check where C: is again as well!]

This is a tricky area to fathom and may be nothing more complex than a
sluggish ftp server (or ftp proxy). The culprit can mostly be
ascertained with Nos which will produce reams of (incomprehensible)
data if told. A "traceroute" can sometimes help.

It happens all too often with a PC as well btw!

There is an Atari utility called SPLITTER. Apart from its main function of splitting up a large file into smaller chunks, it also generates checksums, which will allow you to see if the datafile has changed. More importantly for your purposes, it comes with the C source code. This takes only minutes to get compiled on a PC.

The only other possibility is a coincidence. Perhaps zoo and gzip
attempt to allocate more memory than is available on a 520 machine?

It may not be. If you're using demon's proxy then try without it. I've found of late that it is all too quick to say [blah] link is unavailable (this on a PC). Possibly this is manifesting itself as you describe with Cab.

If Cab is still the same as it used to be then I used to have the proxy on by default but when I suspected it to be mucking about, I just hit escape in the proxy field to clear it whereupon Cab would go direct. Later it could be restored by clicking on the "default" button. Hopefully it still does this.

The problem with a "alt.binaries" newsgroup is that many smaller ISPs, community networks, etc. do not carry any of them - too big and too much smut, don't you know - they've got a bad rap. Yes, it's there, but how many in the Atari community can access it. I cannot.

What you need is Andreas Winter's VMG4000 utility. It is shareware, but with the fee automatically paid when you have NVDI ET4000. Updates ouht to be available somewhere on the Net - check for filenames like VMG4000, VMG-4000 or ET4000.

The latest version I have is from April 1995 v1.12. Docs are in both English and German.

I can ZIP my archive to about 100k if you can't locate it.

Does anyone else have a newer copy?

I can't say I'm too sure, but I thought it was a FidoNet requirement (you know how officious they can get) but tbh I haven't used it on the FTNs for years - even when I post to Fido.

For all we know, the requirement may no longer be necessary, but no-one's ever pointed it out...

Is there an RFC for this?

I'm a bit confused here. Having been offline for six weeks I came back to
discover that the english HSModem docs (which had been translated by the
TransAction crew for about a year!) had finally been approved for release by
Harun. Has this not been announced?

I've just read through all the texts and I have to say the quality of the
translation is extremely good, especially given the nature of the subject.
The guys that get the credit are Mick Lock, with help from Peter West.

The file is named HSM7DOCS.ZIP (44126 bytes) and was uploaded three weeks ago
to Meon Valley BBS in the UK (+44 1705 632199) (90:100/300) for circulation
on Fanfiles, and to the atari.st/files98 topic on CiX.

Is it not available on an FTP site yet?

==========
atari.st/2comms #2837, from mlocka, 1388 chars, Jan 11 20:47 98

Peter and I have the warm feeling that we've provided a little more
enlightenment to the Atari community 8-)))

They can be spread to the four corners of the world and beyond. Harun says,
and I quote;

----------snip--
To make it very clear:

You and anybody else may distribute the Docs.

I do not wish that any translation is kept under the carpet.

I did not release the Docs. But it was never my intention that I have to
release translated Docs, I mean translations do not require my approval.
--------snap--

and as to the future of HS MODEM the following;

If I have time and fun, I will release a HSMODA08, including the English
Docs. But the drivers still do not have the state I like to have in HSMODA08.

So there you have it Harun is still very active in the Atari scene.

Regards

Mick Lock

Peter,

With MagiC 4.0 things are no better. Yes, you can escape from CAB, but
it really doesn't do you any good. The CAB window cannot be removed from
the desktop, nor will the minimizer button work. The only programs that
you have access to are ones already running and even then things can
react in a strange manner.

James, simply format the 3.5 inch disk to a 720K disk (if your Atari
has a double sided drive like the SF-314 drive or double sided
internal. Use the PC Command like this
Format a:/f:720/u
and this will format a disk to where a double sided Atari drive should
be able to read the file from it. Then copy the file like this
Copy C: <Filename.ZIP> A:\

that should do it for you.
Feel free to e-mail for more specific directions if needed.

2456. PDF viewer for GEM?

Newsgroup: comp.sys.atari.st
Date: 1998-02-04 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <QPRUCSO@tos.pl.net>
Source record: 108365

I need to be able to view Adobe Acrobat PDF documents under GEM on my TT, and although Ghostscript does the job, it is really difficult and tedious to use for on-screen display (and very slow), and also it won't print via a GDOS printer driver or use GDOS fonts.

I wonder how difficult it would be to make a PDF viewer that is more useful in the areas where Ghostscript isn't? Or does such a project already exist?

Could someone please translate this? Peter West? :-)
```

I think I understand that last part, that this discussion is
meaningless,
but Andreas has still not said if the _FRB cookie is setup correct or
not
under MagiC. Uwe says it is but Andreas _have_ said before that it's not
and
that MagiC uses another hidden buffer.
.
Just answering that question would rule out a few things.

Sometime I get the feeling that people doesn't want to help and explain
what the problem is. Insteed they just ignore the questions. That
certainly
isn't a professional way of doing things, even if the other person is
wrong.
If I'm wrong, then tell me and don't ask me to just prove things I
can't.

Actually, if my memory hasn't gone corrupt, Marcel was shareware gone
freeware, which is quite a difference.

There are some shareware sequencers still floating around though. Look for
Sweet16 which is the only one I know of that is still supported. Try:
http://home1.swipnet.se/~w-11396/

>What is that meant to say ? :-(

I for one would be very interested in an easy to use MPEG conversion interface (that works) on the Atari platform. It would be nice to be able to capture video with Expose or ScreenEye within an application and have the ability to export MPEG format. FL* retain excellent resolution, only who else but the originator can view the files easily (when they are ~30 to 40mb in size?). Actually, I would settle for an AVI or MOV output option from within Apex (probably never happen). As it stands now, the closest thing to cross platform video export utilites available is MPlayer (easy to use, ect). The problem here is Apex does not save individual TGA files easily (it will however import them in sequence automatically). Still, MPlayer does not produce compact enough files to really be of any advantage. Your still stuck with a file that can't be easily moved anywhere off your computer across the Net (at least not on a 33.6 modem:).
Aside from Apex, Tripod, and the original ScreenEye software, the only other application that supports video capture from one of these cards is a shareware program from Germany called FunPaint (maybe FunnyPaint). I found a demo on one of my CD's, but if failed to run on either of my Falcons (040 and 030).

>
>I don't know what others think about this, but I find your attitude
>pretty much negative, in fact, IMHO, downright insulting :-((

I almost felt that he was disgrunted about maybe not receving proper shareware fees at some point. Granted, most shareware authors do not ask very much for their hard work, but it is difficult to exchange currency across countries most of the time for such small amount. I must order currency for outside the U.S. from my bank at a fee that usually exceeds the shareware fee, plus wait three to four weeks for the note.
I just recently tried to obtain registeration for MPlayer through the North American rep. I used my VISA for the fee, which makes it a heck of a lot easier. Still it has been near two weeks with no key. Registering direct would be quicker, but how to overcome the currency problem?

Or maybe, like you say, it is just a negitive attitude. I have a 15 year old that is getting that way:).

Hi Greg,

The Dialer hangs on me a lot too. When this happens, I just hit abort and then connect again. Usually things work then. Rarely do I have to do it twice. It looks like it stops while reading the scr file. Sometimes it stops at ATZ, other times at the ATDT1234567 (dial) part of the scr. But, like I said, it always works once I abort out and just connect again. It's better than the dialer thinking it is already connected like in the last version. I don't know if the dialer is improperly reading the modem status, or it is being reported wrong somewhere else. Hardware wise, Gregs and my machine are much alike.

Go to www.blackdown.org/~hwb/hwb.html

Search around for the html files for the SC1224 and the N64 video pinouts. I have seen an SC1224 display composite, but the N64 has the ability for S-VHS, I think.

They could be PC self-extracting ZIP files too. Rename to *.zip and see if
STZIP will work on them. Also at least one ST program (Cubase) uses cubase.exe
as its main program file. Cubase.prg must be a starter or loader program.

This is ridiculous. XaAES is useless and very buggy. It can't even draw
dialog boxes correctly or handle clipping correctly. oAESis is a better
but far from useable. Comparing them with AES 4.1 is a joke. Okey AES
4.1
(not the one released with TOS 4.92) might have some bugs but it works
and I have used it for days without problems.

2469. Seek MiNT-aware binaries for GNU textutils

Newsgroup: comp.sys.atari.st
Date: 1998-02-04 00:00:00 UTC
From: grayc@btm0qt.btm0qt
Message-ID: <GRAYC.98Feb4093721@btm0qt.btm0qt>
Source record: 108378

Does anyone know where I can find (68000) binaries for awk, sed, etc. which aren't restricted to 8+3 filenames? All the ftp sites I can remember off the top of my head are carrying versions compiled in 1994, which are almost certainly the ones I already have. (Thought I was going mad when every time I tried to make CD-index.fr.html I got CD-index.de.html instead. :{)

(I'd compile my own if I could find a gcc distribution that wasn't either a complete MiNT installation or an update to something one is already presumed to have: but that's another story.)

2470. Problems with 030 and Internet

Newsgroup: comp.sys.atari.st
Date: 1998-02-04 00:00:00 UTC
From: Marco Pennings <pennings@travelplan.com>
Message-ID: <6b9aj2$jf1$1@news.IAEhv.nl>
Source record: 108379

We have big problems connecting a Falcon 030 to the internet. we use the
following software:
STIK 1.08 (we think it works properly, it establishes a SLIB connection)
Cab 1.5 : This one is the problem (we think) It works perfectly when we use
it local but as soon as we go on the Internet, we get the most strange
messages (File not found '\" etc.). We use the latest version of the CAB.OVL
file and we use the especially for Falcon compiled CAB.RSC(?)

If someone has got any hints & tips please mail me (pennings@travelplan.com)

Thanks very much!

Marco

Well I have got a AB040 Falcon with Nova card and it's slow. If I run in
TC
mode it almost useable. You realy need a fast CPU for this stuff.

Sure. I will do it right away. I have already asked him about STiNG
support
and he wasn't completely against the idea. I will try to ask what is
needed.

.... done it....

Well, I'm no expert but I try to understand what is needed. From my
point
of view the "standard" is the unix style as most programs available in
source
format relys on it. And I think the Berkely sockets is the most used way
of doing things and I would guess the Amiga TCP/IP API is bsed on BSD or
berkely. Don't ask me what the difference are between Berkely and BSD...
is it the same thing?

Anyway, I have faith in you that you will do the best TCP/IP socket
around,
so I think we will be one happy family in the future. Great to hear that
you have already started on the BDS layer for STiNG.

Oppsss I forgot. You could also take a look at the library for the
TCP/IP stack of Adamas. There is a downloadable Berkely compatible
socket library on the webpage for Pure-C.

I tried that- it hangs on the same article again. If I download the
article to read on-line, it still does it- I have to delete the article
to clear it. At least it's consistent.

I haven't tried waiting more than about 10 seconds to see if it clears.
There is a 'handshake' after this time- the modem lights flicker
briefly, but the download doesn't continue.

I think I have sorted the HDD activity. It's still updating DEFAULT.GRP
on the HDD, so there must be a path I haven't reset to the RAMdisk
somewhere.

I'm now copying just the MAIL and OFFLINE folders to and from RAMdisk,
and running the software from the HDD.

From: Michael Clemmetsen <m.clemmetsen@sunderland.ac.uk>
Message-ID: <34D83EF2.89102BE2@sunderland.ac.uk>
Source record: 108385

Hi,

I missed the beginning of this thread. But as I understand it the original question was "if you have a Falcon and you enable Background DMA in HDDriver with Magic (> 4) does it really work or does it cause problems?"

So my question is: what's the answer to the first question?

Thanks,

Michael

2477. Background Printing with Magic & NVDI & Papyrus5

Newsgroup: comp.sys.atari.st
Date: 1998-02-04 00:00:00 UTC
From: Michael Clemmetsen <m.clemmetsen@sunderland.ac.uk>
Message-ID: <34D84F83.3D715A7A@sunderland.ac.uk>
Source record: 108386

Hello,

Has anyone managed to get background printing working with the above combination. I can only get Papyrus to background print if I use a Papyrus printer driver. I was under the impression that if I enabled spooling in NVDI (i.e. set the spoolpath variable in nvdi.inf) and also set NVDI to use the Fast Print (FPRN) driver that is installable under Magic, then printing would be faster and I could use other programs or continue using Papyrus while it was happening. What actually happens is that the busy bee appears and all signs of preemptive multi-tasking are absent from my Falcon until the print is complete.

Any ideas?

Thanks,

Michael

For the info you need PROFILE from:

www.stsd.demon.co.uk/linnhe.html

or you could use SYSINFO v4.01, or the new HARDWARE.

For a few basic tests try ATARITST.

He Petter,

I has used Connect for a long period on my TT using the serial 2 port.
I didn't have problems with it.
I'm not sure about it but is it possible that serial.cpx and Connect
doesn't work together? Try the modem.cpx instead.

Best bet would be to go with Brad's outfit, Best Electronics. He can help
you with just about anything you'll want for your Mega ST...There was a
guy posting a message about a Mega on here the other day. $60 was what I
believe he was wanting. Good luck! ;-)

You can run a small utility like sysinfo. It can be found on most FTP sites.

Usually, if the machine hasn't been modified, you can tell by what's on the
front sticker.

Cheers,
Nick

Seems like Demon are good for something then. There could be another
possibility for why the ISP would disconnect. It could be that it is the
modem, rather than the ISP, that disconnects because the state of the DTR
alters and the modem isn't told to ignore it. I set my init string to do
that after finding that with every reboot came a disconnect. Now it's
usually a case of reboot and carry on. Sometimes it doesn't work, but
more often than not it does.

> >> So have the port inactive by default, and your comms problems will be gone.

As I said, unless I'm connected, Sting is no longer enabled. As for keeping
the connection through reboots, I guess I'm lucky. I just hope it stays
that way.

Have you tried using the task-switcher popup? It's got a 'start program'
option in it, and it can send CAB to the background. I know it works
because I've done it when CAB/CAB.OVL freeze for a while. I usually
start up Stings dialer to check what's happening.

There's also any programs listed in MAGXDESKs Object menu, these are almost
always available, unless you've set CAB to single-task.

BTW, I'm using Magic 5, but since the info was in the manual, which is
for Magic 4, there shouldn't be any (noticable) difference.

I have to agree here. I think it's a very good idea. But I guess it's best
left to people's own personal preferences.

I'm going to remove it from POPwatch. If people want it then they can always
add it to the start of their sigs. Not exactly tricky :)

I agree with this. POPwatch will no longer put it in automatically, and then
it's up the indiviual concerned.

>Cheers Peter

As you can see, Oasis2 nicely chopped of your sig without me having to do a
thing :)

Shockwave Audio is actually MPEG Layer 3 compressed audio (MP3) it's
highly compressed audio and needs a reasonable amount of power to
decompress it almost certainly more than an ST has goot. I think the
Falcon should be OK and IIRC MP3 players are available for it...

It has been so long since I have had to know WHAT I have, that I'm not quite sure.

But... I think I have a Mega (4?) with two hard drives (2 drives for sure.) :)
Both have been partitioned and now one of them has disappeared. I tried to "install devices" but nothing happened.

It used to boot up and say there was another disk. Now, it doesn't.

Can anyone tell me how to find my drive?

Please email me also as I don't get to this forum often.

>> und ein FRB angelegt.
>> Bekanntlich verwendet die Floppy das ACSI-DMA. Bei jedem (!) Zugriff
>> auf das TT-RAM wird der FRB verwendet. Sonst nicht.

On a TT always a FRB and a cookie is created, even without TT-RAM. Floppy
uses ACSI DMA, therefore the FRB is used if TT-RAM is accessed, *not* other-
wise.

>> Problematisch sind Rechner, bei denen der FRB nicht beim Booten
>> angelegt wird, z.B. bei einem ST. Wenn dann ein Maddalt() kommt, wird
>> der FRB extra angelegt. Das habe ich fï¿½r irgendeine der ominï¿½sen
>> Beschleunigerkarten eingebaut.

There is a problem with machines where FRBs are not created at boot time,
for instance STs. If some tool calls Maddalt, the FRB is created afterwards.
This is an extension aimed at accelaration boards (PAK etc) which bring their
own Fast-RAM.

>> Nun kam neulich jemand mit irgendeiner
>> anderen Beschleunigerkarte und sagt, daï¿½ genau das Probleme macht und
>> daï¿½ MagiC selbst keinen FRB anlegen soll. Daher bin ich diese
>> unselige Diskussion ziemlich leid.

Now someone else starts saying exactly this creates problems, and thus
MagiC should not create any FRBs. Hence Andreas is sick of this discussion.

>> Ein ganz anderes Problem ist angeblich, daï¿½ MagiC bei Maddalt
>> zwar einen FRB anlegt (muï¿½ es ja wg. der Floppy!), aber keinen
>> Cookie eintrï¿½gt. Das ist ein echtes Manko.

Allegedly there is the problem that MagiC creates an FRB at Maddalt, but
does not create the cookie. This is a real bug.

>> Aber: Das Cache-Inkonsistenz-Problem lï¿½ï¿½t sich natï¿½rlich nicht
>> dadurch beheben, daï¿½ man den FRB nicht-cache-fï¿½hig macht. Denn der
>> FRB wird nicht fï¿½rs ST-RAM verwendet. Jedenfalls nicht von der Floppy.

But : The cache inconsistency problem cannot be fixed by making the FRB
non-cachable. This is because the FRB is not used if ST-RAM is accessed.

>> Also ist die ganze Diskussion vï¿½llig mï¿½ï¿½ig und nutzlos. Es gibt
>> zuviele Kombinationen von Rechner-CPU-Plattentreiber-Beschleunigerkarte-
>> RAM-Karte, als daï¿½ ich noch durchblicke.

Therefore this discussion is pretty much futile and obsolete. There are
far too many combinations of boards, CPUs, accelarator-cards and Fast-RAM
add-ons.

Now my own on this : ;-)

The last point by Andreas should make clear what is to do. Regardless how
the FRB is treated, there is always the problem of cache inconsistency in
ST-RAM since ACSI DMA can access all ST-RAM without telling the cache. (This
is even if no ACSI device is connected, as the floppy uses that DMA too).
So unless your cache supports bus snooping, you have no choice, you must
declare all ST-RAM as non-cachable. The only fairly sensible exception is
the MagiC code, it is unlikely that one wants to overwrite that one. But
then this area must be marked cachable only by an AUTO tool that runs AFTER
MAGXBOOT.

> Could someone please translate this? Peter West? :-)

My name is Peter too so I guess I can do it just as well ;-)

> but Andreas _have_ said before that it's not
> and
> that MagiC uses another hidden buffer.

I guess you misunderstand him. He meant not a (localized) hidden buffer, but
all ST-RAM.

Cheers Peter

You don't *want* to understand me properly, do you ?

In article <6b9a3i$mp9$1@infomania.emw.ericsson.se>,
Magnus Kollberg <magnus.kollberg**@**emw.ericsson.se> writes:

> This is ridiculous. XaAES is useless and very buggy. It can't even draw
> dialog boxes correctly or handle clipping correctly. oAESis is a better
> but far from useable.

I reiterate again : I said they are imcomplete. But even though Craig
hasn't touched XaAES for months, there is the hope he'll proceed one day.

Apart from that, XaAES' bugs are not the same as MultiTOS bugs. MultiTOS
draws dialog boxes correctly, but it cannot leave the system running for
any longer than half an hour, then it crashes, in an entirely unexplicable
way. This is MultiTOS' kind of bugs. XaAES has problems drawing more complex
dialog boxes correctly, but at least it does not take down the system all
the time. If it does due to some strange hardware situation, you have the
source code so that you can fix it. Needless to say which kind of bugs I
can live with, and which kind I cannot. Fortunately in fact nobody has to
deal with either of them, as there is the proper solution NAES for MiNT,
and even better (in terms of speed) MagiC.

Since I'm tired of getting misunderstood, here is a conclusion after which
I won't say anything more the issue of MultiTOS against others.

This evolved from some complaint that STinG has problems with MultiTOS.
It's true there are some problems, but they can be clearly tracked down
to Multi-TOS. Still a fair number of people managed to get STinG working
properly even with MultiTOS. Hence I'll continue trying to fix any compati-
bility problem with any AES, except MultiTOS. If you have problems with
STinG under MultiTOS, and you can't live without MultiTOS, stay clear of
STinG. Use MiNTnet, PPP-Connect, Wen.Suite, Draconis, NOS, ka9q, whatever,
there are plenty of TCP/IP stacks around.

Cheers Peter

> PRIVELEDGE VIOLATION error :(

This really drives me crazy. I know if one day I cease programming Atari
it is because people never read documentation. I used to react strongly
if germans ask something that is elaborately explained in the FAQ. Usually
they apologize by saying they have a hard time reading and understanding
english. Fair enough. But this guy gets documentation in his NATIVE language
delivered with the package, yet he does not bother to take a look. :-((

This priviledge violation thing is one of the many little things STinG
gains it's nice speed and reliability from. It creates a problem with other
software that catches system vectors in an illegal way. MiNT does such
illegal things, therefore the problem. This is easily solved by rearranging
the AUTO folder sequence such that STinG loads after the offending program.
As a general rule of thumb STinG likes to load last.

You'll find that you got to "Disconnect" in the Dialer first each time
if you have the port set "active" in the CPX when starting to dial. If
you do not set the port "active", the Dialer will come up with the button
labeled "Connect", no need to "Disconnect" first. The Dialer does that
setting to "active" automatically.

Do not confuse the port active flag with the global STinG active flag.
The latter is in "STinG Internals", and should indeed be saved being
set active. Note I was not talking about that one in my first paragraph.

BTW. it's all described in the docs (maybe a little short at the moment).

> What's going on?

I don't know. Maybe you accidently set the port to some values the modem
does not understand ? For instance the modem won't receive the command
if it's a 14400 bps model and the port is set to 115200 bps. Check out
"Serial Setter" (i.e. SERIAL.CPX).

No need to, the Dialer does it automatically if "Add Default Route" was set.
Apart from that, this does not influence the dialing action.

For the Internet, the term standard is pretty clearly defined. Check out
RFC #2026. POP3 is a true "standard" by this terms (i.e. all way down the
standards track) with status "elective". It's "standard #" is 53.

> Yes, it is a standrd, and MUCH better than pop3, in many areas, but

Aha. Just looked up std1, which appears to say IMAP4 is a proposed standard
i.e. at the beginning ot the standards track.

> berkely. Don't ask me what the difference are between Berkely and BSD...
> is it the same thing?

Yes they are the same.

There is propably a lot of confusion here. There is no standard at all on
the API level. API is (IMHO anyway) the level where you can access the
services (here : of the TCP/IP stack) in a way that does not require any
library. In this sense, the surface of STinG or STiK is an API because
you can find out function pointers to internal functions, and call them
directly. The #defines in the include files are merely macros. In this
sense, the TRAP level of GEMDOS is an API, since you pass parameters on
the stack and do a trap #1, and you're inside GEMDOS.

On the other hand, in your C programs you'll hardly ever use the API. What
you do use is the library sold with the C compiler that translates the
C subroutine call Malloc() into the API call "move.w #72,-(sp) trap #1"
This library level I won't consider the API anymore. The difference is not
very obvious here, as the library involved does so little. With networking,
the difference might be more obvious. The call connect() is part of the
BSD sockets definitions, but I doubt any of the so-called BSD compatible
stacks implement it. They do implement something proprietary on a lower
level, and provide a library that contains the connect() call as a subroutine
that in turn calls (possibly many calls !) the lower level to carry out it's
action. On that lower level (which I'd call the API) there does not need to
be any correspondant call, just a combinations of calls that together with
some processing carries out the action that BSD defines for the connect()
call. BSD only defines the library, it says nothing about how the library

call puts the actual stack to work.

The API of MiNTnet is not documented, in order to see it you need to examine the source code, and the source of the portlib (which for MiNTnet is that library I was talking about). That does not matter, as people will use the portlib anyway, and the functions provided by this lib are documented by the BSD standard. This is why MiNTnet is said to be BSD compatible. It makes sense as people can go and start programming using BSD calls, the library provides them.

The API of STiK and STinG *is* documented. Just like MiNTnet, it's proprietary. The difference to MiNTnet is that the library providing BSD calls does not exist yet. This is the only reason why people say STinG is not BSD compatible. Again it makes sense as you cannot simply go and start programming using BSD calls. But, considering the TCP/IP stack per se, without any library, MiNTnet is nothing more BSD compatible than STinG or STiK is.

This also means, once the library for STinG exists, there is no difference anymore between MiNTnet and STinG in terms of BSD compatibility. At least if I do not create too many bugs, that is ;-)

I should note here that there is no accurate definition of the word API. Some people might be used to using it in a different way, maybe applying it to libraries too. But my point is independent of the meaning of that word, and I hope I got my point across.

Cheers Peter

You can call this a design flaw of GEM if you want, as it requires action
by the program (here CAB), but in our case this happens to be frozen, so the
actions cannot be carried out. There is hardly any way around it. The only
way were doing the network access via some thread under MagiC 5. I've proposed
that to Alexander, but apparently he is afraid of the work that is involved.
I don't know if he seriously considers implementing it. Maybe if you talk to
him.

> The only programs that
> you have access to are ones already running and even then things can
> react in a strange manner.

You should have access to the desktop, so you can launch other programs.
You can put CAB's window into the background by using MagiC's background
button. You can also use the "launch program" entry in the MagiC menu. And
things should not react in any strange manner. It certainly does not here.

Tom, that "Mountain Reader" you're using does not include any "References:"-
lines, therefore breaks Usenet message chaining. Please look out if you can
make it comply with certain Usenet standards, by switching on an option or
something similar. Also, an "X-Sender" line were nice ;-)

Do not use both. You can use FSER instead of HSMODEM, but I won't recommend
it. Use HSMODEM.

A GAL is a little chip that can be programmed. The code that goes into the
GAL is in the FSER distribution IIRC. This chip then replaces another one
inside the machine.

2513. MagiC causes Falcon030 Unstability - Better Multasking OS?

Newsgroup: comp.sys.atari.st
Date: 1998-02-05 00:00:00 UTC
From: Mike Saeger <wanda@xnet.com>
Message-ID: <Pine.SOL.3.95.980205210429.13950A-100000@typhoon>
Source record: 108222

Sadly, I had to delete MagiC from my Falcon030.
1. Unexpeced sloooow downs. Type a key and see it on the screen seconds later.
2. Extendos became unstable - not always to access CD-ROM drive
3. Boot problems - get message **System Destroyed** messages.
4. Desktop not as good as TOS - Can't assign function keys to Icons
5. Unexpected system lock ups
6. Can't use downloaded desktop icons from TOS - MagiC icons not very good.

Is there a better multitasking OS for the Falcon030 that is more stable than MagiC or might there be problems with my installation?

With MagiC removed - my Falcon030 is very stable.
Thanks!

MK>
MK> Well I have got a AB040 Falcon with Nova card and it's slow. If I run
MK> in TC
MK> mode it almost useable. You realy need a fast CPU for this stuff.

Hi Magnus,

same thing on my TT with 20 Megs and TC-1208 plus NVDI-for-Matrix. It's about 1
fps in truecolor (display = TINY). In 256 colors I'd say framerate is about 3
fps...
That means we need a 68080 on 200 MHz for 1stGuide?
When using Aniplay on MOV's or AVI's it's nearly real-time on a 320x200 screen,
including sound... the CD-ROM drive (4.4 speed) probably being the
bottleneck...
Aniplay doesn't play MPEG however :-(

Unforunately, not. They were acquired (and basically shut down) by
another company (which, insidentally, has gone down the crapper since).

> the one system that i have working right now is, i
> think an st 40.

1040ST perhaps?

> where you set monitor resolutions and low and medium are greyed out only
> high is availible thus all my icons are tiny.

You have a high resolution monitor. The other two modes are for the other
Atari monitor (which is color).

> hard drive, but when booted i see a and b floppy and c, d, e and f drives.
> is it partitioned?

Probably so. Older versions of TOS limited partitions pretty small, and
the "cheats" to get larger partitions where disk and speed expensive, so
it's probably several partitions on one drive.

> if you know where i can find some tutorial type of info on
> operating the atari os i would apperciate it greatly.

There are quite a few web pages out there, although I haven't really seen
any of the tutorial nature. Anyone else? In any case, you can pick up a
lot of good info by reading the others too. Search on Yahoo.

Hi there!

My wife an I just got a full PPP account, one reason being so she can do her University class Internet projects. It's a music class, on who's web-page there are musical examples that the students must listen to. The problem is, the audio file format is one I've never heard of: Shockwave. It's file extension is *.swa, and it is embedded in the HTML source, so I can't get LPS124.TTP to try to play it, and I can't download, either. Does anyone know a way around this using CAB?

Mike Freeman

: by the way the STiK API works. It's a limitation, but not a very bad
: one IMHO.

Well, I continue to be impressed by how much has been accomplished with STiNG and CAB, and I know I am pretty much picking at nits at this point. But I still think a work around for this problem can be achieved. Especially since I suspect both of the primary parties (the author of STiNG and the author of CAB) are actively upgrading their programs and willing to work together on certain issues.

My main gripe is that, while I can use CAB's window gadgets while data download and CAB format this data to draw the page I am about to visit, in other words I can continue to read the current page, even if this means scrolling around, while the next page downloads (and I have a 14.4 K modem, so their will some time involved in the download ;-), but I can't use the window gadgets during the resolve and connect stages. Certainly I can see the logic in the thought that CAB can't do anything until the new host is resolved, but this isn't actually true. CAB can continue to show the page that has already loaded. Blocking CAB in the way that is currently done doesn't not allow this.

Perhaps the API needs to be exteneded with another call, so CAB knows that the host has not been resolved yet, so it should just hang tight on that front but meanwhile it can continue to display the page currently in memory. I realize that a solution of this nature would require the efforts of Peter, Alexander and the CAB.OVL author, Dan Ackerman, as well. But I just wanted to put my two cents in to say that I think it is worth it. And certainly the time to do it is while the relevant authors are all still actively fine tuning their products (it is too easy for me to say these things, since I can't code myself, but I will do whatever I can to help ;-).

Mike,

I am afraid you are stuck - Shockway is an extension to NetScape and
MISE. Even with these browsers, at least some of the older versions, you
needed a plug-in to allow access. Its the latest and greatest and a
PITA.

The main reason people use this sucker is that some of the web authoring
programs (Macromedia's Freehand and others) allow you to embed
audio/video into the HTML code without ever having to know what you are doing.
The problem, of course, is that without a browser that accepts the
Shockwave plug-in, you cannot access the embedded multi-media
experience (if I really wanted to watch TV, I would watch TV).

I have only two suggestions.

1) Make contact the author of the web page and
request that he/she make the files avaiable at an ftp site in their
native format - most likely wav or midi. Being that the page appear
to be on a University server - this should not present a problem.

2) Buy a cheap Mac or PC and use NetScape. Personally I would fight for
number 1 :).

Stephen,

It is a 3.6 volt lithium battery. Radio Shack will have to order it
for you. Suggestion: buy a battery holder at Radio Shack for 2 AA
batteries; put in two alkalines; clip the leads from the original and
attach to the the battery holder; tape it in place. Keith Gerdes
recommended that substitution and it's been working fine for me.
Apparently 3 volts is more than enough to run the clock chip.

The fact is that I did recieve a letter voicing a complaint. I did
however, sucessufuly refrute the claim. that my posts were inflammatory.
Please produce any recent posts of mine which are inflamatory?

I barely use my cedarnet account because I do not need it anymore due to
my current one which I mainly use it for work related and email.

The reason I have not been able to respond lately is that I am busy
earning a living. I have been too busy with the CompUSA/Apple store with
in a store(SWIAS) roll out than keeping up with this debate.

You did leave out that Umax does make sub $1000 clones.

>are Ivan Boesky and Mike Milken :)

Not exactly. Apple wrote off a lot of things that did not actually cost
billion. You need to look at the balance sheet to judge.

>> 2) you claim that Apple is stable. Why, then, did a well-respected

>"too slow".

Your bro is correct that I do need a life. Once the Apple/CompUSA roll
out settles down will sample all the home grown beer brew in Texas.

I still stand by my asertion that Mac software at Best Buy can be piled high in many rows.

Still beeting the dead horse that the 060 can outperform the PPC.. You need to take a test drive on the G3 PowerMacs..

> I should also point out that not everyone has access to such a
?supposedly

>well-stocked store - the places I've checked out in Toronto are

>least five, with Arkon gone, the place at Spadina and College turning
>>into a PC store with some Mac support to survive, and even MacWarehouse
>slowly evolving to survive.

As I stated clearly and precise before--I used Best Buy as an example not Computer City. I never been to a CS before. Apple is now out of Computer City(also Best Buy, Office Max and Sears) except in the Canadian province of USA. MacWarehouse is being eaten alive by others such as Club Mac and Cyberian Outpost because they discount thier Mac hardware and are thriving. Would you pay $1999 for a G3 233 PowerMac while Club Mac has the same model listed for $1750?

>
>> Just remember these things and keep asking them. Be sure to ask him

>real difference in speed - and when a computer like the Hades/DirecT is
>made in smaller quantities than Macs to a more selective market sector,
>of course they'll be more expensive

However you look at it, the Hades/Direct are expnsive regardless. Why not make in large quantities to drive prices down? So much for your Mac expert. Can the current 060 Hades run the current software and tools such as QT VR, Quark, Page Maker and MS Office 98?

All the Best..

For a very basic setup, I've been using Freemint 114 in my auto folder and
AES 4.1 in my MultiTos folder. With my Nemesized Falcon, and NVDI 4.12,
this is a pretty fast arrangement. However, although I've got STing working
via PPP just fine, I couldn't get it to work with this setup. (it goes all
the way through the logon process, even to the point of saying "success"
but when I try to run Newsie/Cab/Popwatch/AtariRC, they just time out) Its
really funny though, because it does work with AES 4.0 (in fact, I'm doing
it right now-but AES 4.0 is way slower than AES 4.1) I would really like to
try N.AES, but so far, Chro-Magic and Systems For Tomorrow have been unable
to find out how to buy it. Anybody know how a N.American Atari user can get
N.AES? Thanks in advance...! :-)

Listen to this,

It's not a joke.
Yesterday Bill Gates was in Belgium. When he entered a building to give
a conference some one trow a cake with cream in his face. The guy who
did it could escape.
And the best of all, this happened when a camera team was there, so
everything was filmed and broadcasted on the Belgian national television
in the 7 o'clock journal.
It surely made my day :)

I don't know how you would play it, but to download it with CAB look at the page's HTML source and find the embedded *.swa reference. From that, enter the sound's specified server path and filename into CAB's open URL (prefaced, of course, with the correct domain and any initial directories). If the HTML uses a relative path (../sound.swa), change the URL to move up one directory level from the current page. If there are two (../../sound.swa), move up two levels. If the HTML uses an absolute path (sounds/sound.swa), then you know exactly where it is. If you're using CAB 2.5, paste the current document's URL into the 'open URL' dialog and then edit it by hand as needed.

I hate to be picky, but only an STM, STFM or STE (Falcon?) can run off a TV
with an RF/Antenna cable. Other Ataris will need a Scart/peritel capable TV
set and an RGB/Scart cable.

Cheers,

Nick.

For translating web pages, you can also try:

http://babelfish.altavista.digital.com/cgi-bin/translate?

It can sometimes be very funny. I checked out a web page where some kid was talking about his Spring Break, which was translated as , well, a broken spring ("rupture de ressort"). It brings a whole new meaning to your old web pages ;-)

Well, it can be useful sometimes.

Cheers,

Nick.

2553. Connect and Serial2

Newsgroup: comp.sys.atari.st
Date: 1998-02-05 00:00:00 UTC
From: pettert@notam.uio.no
Message-ID: <6bcodoacb1@ratatosk.uio.no>
Source record: 108275

I've just started to use the Serial2 port on my TT instead of Modem2
to get the higher DTE rates.
No problem with Sting, but Connect gives an error message when I try
to select the Serial2 port. All other comm programs I've checked have
no problem with the Serial2 port, which leaves the conclution that this
must be a bug in Connect.

Does anyone know anything about this, and is there a fix?

- Petter -

I have looked through various ST FAQs, but I have not come across
any information on how to run a diagnostic test on a ST/STe/etc.
I want to find out how much memory the machine has, perhaps the
operating system version, run a self-test?, and other basic diagnostic
operations.

Is this information located anywhere?

Someone please help.

As a matter of fact it is one of the best p[laces to get it. It is a
lithium battery, with ultra long shelf life. They dont normally stock them
at the stores, but WILL order it for you, it takes about a week, and you pay
in advance. It is a standard computer battery.

Source record: 108281

Hi Forrest

Atari is no more in the computer business, but there are some
sources to get users support, one of them is here :-).
In regard to the video modes, if you have a b/w HI-res monitor 640
x 400 is the only resolution available, but the most useful for music as
you are interested in. To get color video modes a color monitor is
necessary that is plugged in the same monitor output, or a TV if your
computer has a RF modulator (1040 STfm or 1040STE).
You have a hard drive probably a SH series or a Megafile, and is
probably partitioned or was at some time, given that you can see icons for
drives over a and b. At booting time, turn the HD on and wait for about 10
seconds before turn on the computer, you will ear some "kuirk" noise that
indicates that th HD is up to speed. When booting, you should see a
message from the HD driver (AHDI, ICD, SUPRA or some other) on screen. If
not, you need to obtain one (available on the INTERNET) and install it on
the root directory of the booting floppy disk and reset.

In Houston, there is the Houston Atari Computers Enthusiasts
(HACE) that have a BBS and a webpage (sorry I don't have the addreses
here, but I can e-mail you the info if you want). May be you can get
assistance and an ST manual from them. Also, I can send you a xerox copy
of my Falcon's manual that can be useful as a reference for GEM, with the
obvious differences.
Anything else I will be glad to help.

Regards,

Daniel.

A newer STiK version at least. A recent STinG version would be much better
(STinG does not take any more resident memory that STiK does, perhaps even
less, as the Dialer is non-resident).

A newer version of CAB.OVL, as lots of bugs have been fixed and more features
been added meanwhile. The new versions are also a lot smaller BTW !

I'm not sure which CAB version is included. IIRC it's not V1.5. In that case
one should use that one instead of the WWW131.ZIP package. In that case there
is nothing at all that one would use from the package.

Hehehehe. It's the ASH Emailer. ASH is slowly turning into a Microsoft-wanna-be,
attempting to rule the net. With the Emailer, they've decided that Usenet and
e-mail from now on should be endless lines, i.e. one paragraph a line.

No, it's not a bug as ASH boosts it. They refuse being told that it's bad and
should be changed, I tried to no avail. :-(

I already publicly said that I will not reply to, but discard, any e-mail
written using the ASH Emailer, until they've changed this.

> willing to work together on certain issues.

One of the problems is that a third person is involved : Dan Ackerman for
CAB.OVL.

Anyway, recently I made a proposal that would completely get rid of this
problem under MagiC. Apparently Alexander is afraid of the work involved.
I don't know what will happen.

> My main gripe is that, while I can use CAB's window gadgets while data
> download and CAB format this data to draw the page I am about to visit, in

> use the window gadgets during the resolve and connect stages.

I guess the resolve delay is not that bad as it only happens once each two
or three pages in average. For the remaining pages, and the pics on the
pages, the IP address is taken from the resolver cache, the resolve calls
therefore returns immediately.

The connect delay is worse, as it will happen for every picture or button
on any page, so effectively three to five times a page in average (that's
ten or more times more often than the resolve delay !). This is even worse
as it's not at all necessary. I will ask Dan to stop this.

STinG has a driver that is close to working. But it's compatible only
with MiNTnet, both are incompatible with the PC Linux PLIP. Has to be I
should say as the Atari's parallel port lacks lines that are essential
for Linux PLIP.

> Alternatively, can anyone point me in the direction of a terminal
> program that'll use the parallel port? (Falcon=>VT100 terminal!)

AFAIK you cannot run any GETTY on the parallel port on the Linux machine,
and PLIP is out of question for the reasons above. So forget the parallel
port.

You've said "and the serial port's already taken". What about the other
serial port ?

Peter, yes a lotsa people DO read the docs, but as much are NOT
reading them. I do, and use my atari as much as it can allow me
basically.. Not readng the doc is bad for a user, and too bad for them
as they miss half of the program.

If it's the manual, just reply, (read the manual). That's all.
Evereything is there and you've spent many hours/days writting it to
avoid the frequently asked questions.

Well that's all :) you did your job of writting pretty good docs, now
let the user do a good job at reading them ;)

2580. Converting GEM graphic format to PC

Newsgroup: comp.sys.atari.st
Date: 1998-02-06 00:00:00 UTC
From: Alyre Chiasson <alyre.chiasson@fundp.ac.be>
Message-ID: <6bfmk6$nsp@hermes.fundp.ac.be>
Source record: 108102

Hi,

I use BSTAT to do most of my scientific graphics. Saving in gem vector format makes sense because the bitmap formats are at screen resolution which won't do for publication purposes. I have yet to find a program that can convert Atari GEM (vector) file formats without messing up the labels, the tick marks, the shading or some other aspect that make the result unusable. I usually want to import into Word. Has anyone found a DOS or Windows program that can do the job. A suitable conversion would be GEM to CGM or true vector WMF.

Thanks

>illegal things, therefore the problem. This is easily solved by rearranging
>the AUTO folder sequence such that STinG loads after the offending program.
>As a general rule of thumb STinG likes to load last.

All the MiNT documentation I've ever read also states that MiNT should be
run last in the auto folder. I have tried running other programs that have
trouble with MiNT last, but have never had any success. I guess I just
assumed I'd have the same problem with STiNG.

Sorry for have causing you so much anguish Peter.

> and even better (in terms of speed) MagiC.

From my point of view this is totaly rubbish as well. Ican't make XaAES
live
on my Falcon for more than a minute or two, if I even can boot the
damned thing.

Reccomend something that isn't in a LLOOONNNGGG way finisihed is a bade
idea
if you ask me. And from _my own_ experiences MultiTOS works but XaAES
doesn't.
I guess you have got a super Atari which loves everything except
anything which
has TOS in the name.

> Since I'm tired of getting misunderstood, here is a conclusion after which

> there are plenty of TCP/IP stacks around.

Well I don't use MultiTOS as I'm lucky enough to have got MagiC almost
roch
solid on my little box, but still I wouldn't recomend something like
XaAES
over MultiTOS. Not that I would recomend MultiTOS either. MiNT+AES 4.1
is
okey but not perfect.

Great, atleast I know that now. :-)

<lots of talk about API thingys...>

I would say that an API is the functions you use for accessing GEM, AES,
VDI etc.
Like wind_xx(), objc_xx() etc. But what do I know? :-)

> The API of MiNTnet is not documented, in order to see it you need to examine
> the source code, and the source of the portlib (which for MiNTnet is that

> using BSD calls. But, considering the TCP/IP stack per se, without any library,
> MiNTnet is nothing more BSD compatible than STinG or STiK is.

Sure. Sounds like it would be very easy to add BSD compatibility to
STiNG.
Just add the damned calls! :-)

> This also means, once the library for STinG exists, there is no difference
> anymore between MiNTnet and STinG in terms of BSD compatibility. At least
> if I do not create too many bugs, that is ;-)

Hehehe... as long as it gets done we will be happy. All this sounds so
good and I don't think anyone doubt that one day STiNG will do just
what we and everyone else wants and what MiNT net does, if not more.

> I should note here that there is no accurate definition of the word API.
> Some people might be used to using it in a different way, maybe applying
> it to libraries too. But my point is independent of the meaning of that

> word, and I hope I got my point across.

Yup. Anyway, did you get the Adamas TCP/IP socket library? The header file
with the calls didn't look to complicated. I would say that you could put something together that would work with Adamas in, lets say, 2 hours?

:-)

Saa ya!

Hmmm... this is a very big "design flaw" if you ask me. Okey it's nice
as well as you can handle the iconified window as a regular window as
well,
but it's not very good if the program is doing something and doesn't
react
to window meesages. Under OpenWindows this is not a problem as the
iconify
button is a part of ths "OS" and therefor always works. Only redraws of
the
window doesn't work. I guess the problem with GEM is that they choosed
to use
windows insteed of just icons for iconifying. But MagiC now supports
window
shading. Does this still work whatever the application is "alive" or
not?
I guess it works as there are no aes calles needed, or?

Another cool thing which could be added to MagiC would be the
possibility
to perform a "hard" iconify. In this case the OS takes over and forces
the
window to be iconifyied. Should be possible to do I think? Even "hard"
move and
size events should be possible. This would be nice features if you ask
me
and it should be possible, I think... Andreas?

> way were doing the network access via some thread under MagiC 5. I've proposed
> that to Alexander, but apparently he is afraid of the work that is involved.
> I don't know if he seriously considers implementing it. Maybe if you talk to
> him.

I guess it would also cause problems for people not using MagiC. I guess
he could
add two versions for everything, but it would be quite alot of work. The
other problem
is that MagiC threads are not compatible with MiNT threads (or the other
way around),
but it would surely be nice if threading was used for several things.

> > The only programs that
> > you have access to are ones already running and even then things can
> > react in a strange manner.
>
> You should have access to the desktop, so you can launch other programs.
> You can put CAB's window into the background by using MagiC's background
> button. You can also use the "launch program" entry in the MagiC menu. And
> things should not react in any strange manner. It certainly does not here.

Still, "hard" modes of some window events would solve most things, if
it's
possible to do ofcourse. Like MagiC does now, with the control key
pressed
you can toggel realtime moving/siezing/scrolling of windows. Why not
make
a similar way for "hard" moving/siezing/iconifying of windows?

Just an idea...

I would say that we need a good news/mail program that everyone could
use would
be much better (maybe MyMail could be that).
Most software is old, unsupported and just outdated. We need some _new_
working
software for the future. Not patched software to their death...

You CAN, but this will not solve your real problems.

It seems you have a what we in Germany call a "monday computer". Some
Falcons and some TTs (not many) simply do not work correctly.
This is the Atari curse.

You can either try to apply a hardware fix, or, simpler, use any
System that does not replace TOS, i.s.:

MiNT (still uses the ROM)
Geneva (dito)
N.AES (dito)
...

Of course, you should install a reliable disk driver, e.g. HDDDRIVER.

Linux supports PLIP as well, but with its own format, incompatible with
MiNTNet PLIP.

>Alternatively, can anyone point me in the direction of a terminal
>program that'll use the parallel port? (Falcon=>VT100 terminal!)

NO, sorry. But if you would need to copy files from/to Linux via parallel
port, check my PARCP.

Source record: 108149

Hello all,

Does anyone remember what the sequel to the excellent game
Midwinter was called. All I can remember is that it was set on
a Caribbean type island somewhere.

Cheers,

Len.

;-) I can understand that. I guess we are all sick on this, but it
doesn't
help until something is done.

> >> Ein ganz anderes Problem ist angeblich, daï¿½ MagiC bei Maddalt

Is this going to be fixed? You did say that you would implement it.

Sounds reasonable. The strange part is that it does work under TOS to
mark the FRB buffer as none cacheable. Maybe TOS treats this different
and always uses the FRB buffer?

> Now my own on this : ;-)
>
> The last point by Andreas should make clear what is to do. Regardless how

> then this area must be marked cachable only by an AUTO tool that runs AFTER
> MAGXBOOT.

This will not work as MagiC creates the buffer somewhere and you don't
know where.
This is why you need the _FRB cookie which isn't valid (see above). You
will need
to mark _all_ ST-RAM including the area where MagiC is located as none
cacheable
and then will everything including MagiC run very slowly.

> > Could someone please translate this? Peter West? :-)
>
> My name is Peter too so I guess I can do it just as well ;-)

Hehehe... sure, no problem. It's nice then people try to help. You did
treat
Andreas more friendly than some other persons who has written here in
german
though. ;-)

> > but Andreas _have_ said before that it's not
> > and
> > that MagiC uses another hidden buffer.
>
> I guess you misunderstand him. He meant not a (localized) hidden buffer, but
> all ST-RAM.

I don't think so. You (actually Andreas trough you) said above:

> Allegedly there is the problem that MagiC creates an FRB at Maddalt, but
> does not create the cookie. This is a real bug.

So this will not work unless Andreas fixes it. Shouldn't be very hard
and he has
said that he will fix it. But AFAIK he hasn't done it yet. I could be
wrong, but
it's realy hard to know what has changed in MagiC as there are no docs
in english.

This is strange. I have never experienced this.

> > 3. Boot problems - get message **System Destroyed** messages.

This is a problem that some people have and others doesn't. One thing
to test is to comment out the _TSL line in your magx.inf file and see
if that helps. It turns off preemptive multitasking at boot. I'm not
sure
at what point MagiC reads this file, but it could be something to test.

> > 5. Unexpected system lock ups

Strange. Could be a faulty program or something in your autofolder.

> > 6. Can't use downloaded desktop icons from TOS - MagiC icons not very
> > good.
> You CAN, but this will not solve your real problems.

You need a resource editor to add new icons to the icons file or you can
just drop an icons file in the rsc folder. MagXdesk will load all icon
files it can find (I'm not sure what the limit is) so you don't need to
have all icons in one file. It should be able to load the icons from the
original TOS icon resource file if there isn't any problems with it.

> It seems you have a what we in Germany call a "monday computer". Some
> Falcons and some TTs (not many) simply do not work correctly.
> This is the Atari curse.

This is sad. Isn't there a way to try finding out what the problem is?
Couldn't
you locate where it goes wrong, atleast at bootup? I guess there must be
german users with "monday computers" which would like to lend you one to
test with? I think many would appreciate if you could atleast locate the
problem
and explain it.

I could try to help you if you want.

I have a selection of Atari ST titles for sale.

This List Dated 6/2/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
SCSI SC-ROM drive, Atari CD ROMS, 16-bit sampler cartridge/hardware.

All are on original media. I may be interested in part exchange/swap W.H.Y.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

>>>>>>>>>> All prices are in UK Pounds (sterling) <<<<<<<<<<
^^^

%Peter Rottengatter (perot@suse.modem.stud.uni-hannover.de) wrote:
%: There is no way for the application to do the resolve truely in the
%: background, except using MagiC's threading features. This is dictated
%: by the way the STiK API works. It's a limitation, but not a very bad
%: one IMHO.

%Well, I continue to be impressed by how much has been accomplished with
%STiNG and CAB, and I know I am pretty much picking at nits at this point.
%But I still think a work around for this problem can be achieved.
%Especially since I suspect both of the primary parties (the author of
%STiNG and the author of CAB) are actively upgrading their programs and
%willing to work together on certain issues.

%My main gripe is that, while I can use CAB's window gadgets while data
%download and CAB format this data to draw the page I am about to visit, in
%other words I can continue to read the current page, even if this means
%scrolling around, while the next page downloads (and I have a 14.4 K
%modem, so their will some time involved in the download ;-), but I can't
%use the window gadgets during the resolve and connect stages. Certainly I
%can see the logic in the thought that CAB can't do anything until the new
%host is resolved, but this isn't actually true. CAB can continue to show
%the page that has already loaded. Blocking CAB in the way that is
%currently done doesn't not allow this.

%Perhaps the API needs to be exteneded with another call, so CAB knows that
%the host has not been resolved yet, so it should just hang tight on that
%front but meanwhile it can continue to display the page currently in
%memory. I realize that a solution of this nature would require the
%efforts of Peter, Alexander and the CAB.OVL author, Dan Ackerman, as well.
%But I just wanted to put my two cents in to say that I think it is worth
%it. And certainly the time to do it is while the relevant authors are all
%still actively fine tuning their products (it is too easy for me to say
%these things, since I can't code myself, but I will do whatever I can to
%help ;-).

Is it worth pointing out at this point that the MiNTnet OVL *never* blocks
CAB? Yes Eric, I had the same gripes as you when I first started using
CAB six months ago. At least in this respect, it is not a CAB API limitation
causing the problems...

>number 1 :).

Actually, a .SWA file stands for ShockWave Audio. This is nothing more
than an MPEG Audio file with a ShockWave header glued on the front. You
don't actually need the Netscape or Microsoft plugins to play this file.
But - you need a FAST processor to decompress the audio and play it
back in real time. I have been working on some Unix source code to play
these files, but porting to the ST is difficult. Generally these files
decompress to 16 bit stereo 44khz digital audio samples. I can truncate
them to 8 bits for my TT, and re-sample to get it into a TT-usable sample
rate. But doing this in real time isn't possible with the current state
of the code. Decompressing to disk is the only choice for now, but at
these data rates that works out to 5 megabytes per minute of audio...

I've been considering decoding to MIDI format instead. It would be more compact, and wouldn't require fancy digital audio hardware to play, since every Atari has MIDI ports. (Of course, you'd need to have a decent synth plugged in...)

My attempts at speeding up the process have gone by reducing the precision of the math. (Decoding is VERY VERY math intensive...) The results are pretty ugly sounding, you really need double-precision floating point to do a good job. I haven't given up yet, but I'm beginning to think this is another area where we'll have to leave the 68000s behind. Now I gotta find someone to sell me a 68060 upgrade for my TT...

> can get schematics/board descriptions that would be great!

Before you put it out to pasture, open up your Mega and perform a minor
operation on the square chips on the motherboard. I have found
with my Mega that 99% of my problems have been because of oxidation or
"chip creep", and that the square chips (GLUE, priorietary, and BLiTTer)
are most often to blame.

First gently pry up each square chip individually, noting the orientation
of the chip (just in case it pops out). Once the chip is out and resting on
the chip socket, you can dribble a bit of rubbing alcohol or pure
clinical alcohol on the contact points, and then wiggle the chip back
into place. Do that for all three square chips.

While you're "under the hood", you may want to get the same treatment
to the other socketed chips. And you may have to do it more than once.

I hope this helps. This treatment has resuscitated my Mega (and other
ST's) more than once.

There's a seperate program that you can use in addition to DUET to make it work with Magic. I think it is called DUETMC, but I can't remember where to get it from. You put it in your APPS folder (or whatever) so that it runs when Magic boots and as long as you have it running in the background DUET runs as normal.

Hello-

I'm hoping that someone can steer me towards a copy of Pixel Publications "Super Librarian" for the ST. This universal patch librarian contains a profile for the AKAI S-612 sampler, something that would ease my pain considerably...

Alternately, does anyone know where I might find a S-612 profile for Dr. T's X-OR editor/librarian (a program I already use and feel comfortable with, relatively speaking)??

-thanks

Remove the ASH PPP Connect ovl. You will need the Cab 2.5 OVL for STing/STik.
You will also need HSMODEM.
I don't know what the Falcon files for HS modem are but you will need to
have STing.Prg as the last file in the Sequence. Put you CPXs where they normally
go. Remove the crappy Atari serial cpx for the NEWEST STing Serial CPX.
Create an STing.INF file telling where you have STing directory on the Harddrive.

On the Falcon read the documentation on setting the Serial port.
For more information you can EMAIL me.

> However the above line is a
>little far fetched don't you think ?

No, Not at all or I wouldn't have said it. I believe it whole heartedly.

, The only ftp site to stop
>supporting ATARI is HENSA

Not true. Many FTP sites eliminated Atari software years ago, before I left
the ST in 1992. You just watch them close. I am certain there have been
ftp closures in the last 2 years. I will bet there will be more.

>and although a great site, its never been
>the same since Denesh left, its notoriously hard to log into, only
>open certain hours, and for the last year most titles simply where not
>there when you tried to download,

He did a good job there. He does a great job where he is now. He does good
for us Atari users. I watched him at work (figuratively) as he took control
of the hensa situation. I applaud him.

>There are a large number of ftp
>sites that have the same software, I don't like to see hensa stop
>supporting ATARI, But don't see it as the start of an epidemic in that
>direction :)

It is slow and painless. It is not an epidemic, it is just a reality that others
decide what is important on an FTP site. Atari sometimes gets squeezed. Being
Canadian, we like to pretend to protect all endangered wildlife. I like to
put Atari and Atari software in that category:-).

>
>Plus the majority of ATARI users in the UK..(Dunno about other
>countries) are not on line, thus they would dissagree that anything
>happening on the internet would "kill the ATARI"

The UK hasn't had the internet epidemic yet. It is something so big overhere
in North America that I cannot describe. If 1 out of every 100 users had
purchased a modem and tried to use a BBS in the last 12 years, well now

99 out of every 100 purchase a TOTAL INTERNET package. The boom is incredible. Within 18months many BBSs have been crushed. New users don't even know what a BBS is but they are all internet users. And they are bad users at that:-). For a Sole Atari user in a city where the nearest Atari User is a complete stranger more than 1.5 hours drive and there are no dealers and no software available, the internet is the ONLY lifeline to software and connections to dealers. Alot of fun can be used finding software on FTP sites.

For your information Homa Systems is about 7 hours from me, and Computer Direct is about 2.5 days drive away. I also didn't know they existed until I got on the internet.

I enjoyed my trip to the UK in 1991. I was happy to see Atari STuff. If there is still an Active Atari User base then thats great. The UK and Germany are plusses to the Atari community. But in North America, Atari never got off the ground and really was dead in 1987. Great software, great programmers, great machine, poor marketing, poor sales, poor distribution. Nonetheless dedicated ST users continued, and surprisingly still do. However your experience and my experience with a great computer are very different. So perhaps I shall rephrase the above to, YOU KILL ATARI FOR THE REST OF US FTP SOFTWARE DEPENDENT LOSERS outside the loop on the booming atari scene;-). Oh and how many Atari stores are left? FTP sites are great exploration for me.
>
>Like I say, I agree with your sentiments, but lets get it in
>prospective :)

Well, I will get into perspective, but unfortuneately I see it all to clearly for me. I just am not saying it properly.

>
>There is a school of thought that ftp sites are harming the ATARI,
>After all most people that go on line will stop using ATARI Public
>Domain libraries, why pay when you can download?

System of distribution, path of least resistance.

>, These libraries have
>served the ATARI community for many years through thick and thin, our
>platform survives on PD, Freeware and Shareware,

Hmm, now lets talk about perspective. You say the same thing only with a different spin. PD, Freeware and shareware are created by software programmers and not PD libraries. Libraries are a method of distribution. I say the platform dies if not distributed through the internet. You say SURVIVAL depends on PD being distributed through libraries.

>Yet the more people
>that join the internet, the less people using PD Libraries and if you
>get the majority or a large percent of ATARIans on line, then these PD
>Libraries will fold,

Yes, that is correct. The Internet has arrived and the way is coming, get ready for the splash. PD Libraries must advance with the times and offer

their wares through a controlled FTP site. Increase distribution and Access
to more people.

>
>Let us not forget the input these libraries have had, not least
>Goodmans in the UK for the ATARI shows over the last couple of years,

Not to take anything away from Goodmans. They have little effect outside of
the UK. But anyone who is willing to put on a show is worth supporting. I hope
you support shareware authors accordingly as well.

>how much software would there be on ftp sites if PD Libraries didnt
>exist in the first place?

Just as much as there is today silly:-). PD libraries were the most efficient
method of distribution software for many years when interenet access was hard
to come by. Now in my town in the middle of nowhere there must me 15 internet
providers. Maybe a BBS is left but I can't find it anymore. All my lists
are dead for my own city.

>blah blah blah....you get the general idea
>yes :)

blah blah blah I have bored myself too at 12am.
>
>Sorry this is not a moan, just a few thoughts on another point of view

>

THere used to be over 20BBS in my community. Most have become IPs. THen there
are all the big name trash IPs. There aren't any BBS in my city that I can find.
There rarely ever was any Atari Support unless I created it.

I never/very rarely call long distance to a BBS. Internet is a local call.

BBS unfortuneately are dead. I would like to run one again but doubt anyone
would call. However, just watch I am going to get one up and running in the
next 18months. BBS just can't offer the internet and thats what people want.

I am sorry but the current trend is the internet and if I am going to be on
the internet I look for what my interests are. Thinking ATARI WAS DEAD I took
a look to see if there was any remnents of my old computer lying around.
Surprise suprise, theres lots and I want it to remain that way. I wouldn't
be getting a Falcon if there wasn't FTP sites and a fun good bunch of Atarians
here. I'll get a TT too. And set up a BBS. (I have 3 STs doing nothing ATM.)

You want to impress people now. Show your Atarians (if you can find them:-)
all the neat stuff on FTP sites for them.

Thanks for you comments though.

My favourite things from the 80s.

Well, that would seem to confirm my earlier belief that this had to do with a STiNG API limitation. But Peter can easily, and justifiably, point out that MINT allows for threads, which allows for the standard way of resolving this problem. My belief is that this problem can be resolved without resorting to threads, a solution that would then be useable under Geneva without MiNT and would apaprently require rewriting CAB to accomodate Magic's different style of threads. I think an extension to the STiNG API could be used to keep the address resolution process in the background.

I am quite impressed by the description of the MINT/CAB OVL that I have seen in this newsgroup. But I chose STiNG instead of MintNET for certain reasons and would prefer to stay with this solution if possible. I am sure those that chose to go the other way place a very high value on your efforts, Howard, just as I do on the efforts of Peter and Dan.

My point is that it's a complete package with an installer. It will serve as
a solid basis for getting up and running until they can ask advice here or
read of the current recommendations.

Indeed, but it's about time that a fresh package of recent and, most
important, stable versions was issued as a package. Both STiK and STiNG
versions could be compiled - just as long as some standard settings are made
available in each.

Aloha!

Any of you Atari Falcon/Cubase users out there:

I'm having a problem with getting stuck notes when sequencing
with Cubase.

Latest change...added a Alesis Nanobass and Nanopiano to my MIDI
chain...(which is a star-network btw), and since then I have these
stuck notes when sequencing or during playback or both. Not sure
if it is really stuck notes or garble info received on the playback.
The notes are never the same ones...and always originate not from
the Nano units but, from my Roland U20 Keyboard/controller/module.

Is there a midi-control in Cubase that can turnb these off? or somehow
correct my problem? Can anyone help? Or any idease?

Aloha and thanks

Vern

2620. Re: STiNG and Tosbox emulator on Wintel PC: does HSMODEM matter?

Newsgroup: comp.sys.atari.st
Date: 1998-02-06 00:00:00 UTC
From: Mark Slagell <bald_soprano@usa.net>
Message-ID: <34DB68BF.441E@usa.net>
Source record: 108173

Steve,

In the current release of Tosbox, serial emulation is done at the hardware level and nowhere else, i.e., Atari's setup of using the MFP and other chips to service a hardware port is quite faithfully reproduced. So TOS interacts with Tosbox's virtual hardware in the same way it does with the actual Atari hardware, and therefore TOS bugs can still be a problem; hence the recommendation that people use a patch.

So HSMODEM should, in theory, help with flow control; but if you aren't having problems, then I can't think of a good reason to mess with it. I don't entirely know how PPP works, somebody with a little more technical net-savvy here may be able to answer this, but I suspect it works, by nature, in packets, a kind of logical flow control may be built in.

In an earlier release serial emulation was done at the BIOS level, which was more reliable in some ways, and was less work for me; but it turned out to be incompatible with almost all Atari software. oh well.

Good luck.

A while ago, I got an Atari 520 ST from a friend, so I went out and downloaded some software and bought coverdisks to try it, but whenever I tried to run a program, or even view a text file, the computer would go down, with what looks like two bombs flashing briefly before the machine resets.
What could this be and is there any simple remedy to this problem?

Hey! madmax@bfree.on.ca (Brian Van Tilborg) wasn't it 6 Feb 1998
16:55:19 GMT that you wrote:

>, The only ftp site to stop
>>supporting ATARI is HENSA
>
>Not true. Many FTP sites eliminated Atari software years ago, before I left

I was talking in the last few years, Only Hensa that i know of,

>ftp closures in the last 2 years. I will bet there will be more.

Not that I heard of...

>>supporting ATARI, But don't see it as the start of an epidemic in that
>>direction :)
>
>It is slow and painless. It is not an epidemic, it is just a reality that others
>decide what is important on an FTP site. Atari sometimes gets squeezed. Being

This is true, if they need space then ATARI will suffer :(

>Canadian, we like to pretend to protect all endangered wildlife. I like to
>put Atari and Atari software in that category:-).

hehehe and you can't eat an ATARI ;-)

>>Plus the majority of ATARI users in the UK..(Dunno about other
>>countries) are not on line, thus they would dissagree that anything
>>happening on the internet would "kill the ATARI"
>
>The UK hasn't had the internet epidemic yet. It is something so big overhere

Thus my above statement is correct ?

>Within 18months many BBSs have been crushed. New users don't even know what
>a BBS is but they are all internet users. And they are bad users at that:-).

Yes..BBS are suffering, one of the major UK BBS (AllAtSea) closed
last week :(

>I enjoyed my trip to the UK in 1991. I was happy to see Atari STuff. If there
>is still an Active Atari User base then thats great. The UK and Germany are

There are many User groups forming all over the country, more than
before, not because of more users, but because there is more need for
them :)

>LOSERS outside the loop on the booming atari scene;-). Oh and how many Atari
>stores are left? FTP sites are great exploration for me.

I agree, I don't dispute that, i would be lost without them and fully
admit I dont use PD Libraries or BBS anymore, I use the internet to
its fullest :)..I was speaking for the off line community who being
off line cant speak up in here themselves :)

>PD libraries. Libraries are a method of distribution. I say the platform dies
>if not distributed through the internet. You say SURVIVAL depends on PD being
>distributed through libraries.

Nope, I said PD libraries survival was at risk, not the ATARI, and
they are at more and more risk as more and more ATARIans do discover
the internet,

>Yes, that is correct. The Internet has arrived and the way is coming, get

Yes....in time the inevitable will happen, it is the way forward, sad
for PD Libraries and sad for BBS but in time :(

>>Let us not forget the input these libraries have had, not least
>>Goodmans in the UK for the ATARI shows over the last couple of years,
>
>Not to take anything away from Goodmans. They have little effect outside of

Yes I know, I can only speak from my own perspective, my point was
that these people who supported and kept the ATARI going before the
internet, are now going to be the ones to suffer..

>the UK. But anyone who is willing to put on a show is worth supporting. I hope
>you support shareware authors accordingly as well.

I do not, I dont particularly agree with shareware, I have registered
3 bits of software that I used a lot, 2 i still use daily, I dont
actualy use much else anyway, I believe the ATARI is a hobby platform,
not a money spinner <smile> just my opinion of course :)

>>how much software would there be on ftp sites if PD Libraries didnt
>>exist in the first place?
>
>Just as much as there is today silly:-). PD libraries were the most efficient

I dont think so.. no one would have made PD in the first place if
there was no way to distribute it, the only way I know of doing that
was through PD Libraries,

>method of distribution software for many years when interenet access was hard
>to come by. Now in my town in the middle of nowhere there must me 15 internet
>providers. Maybe a BBS is left but I can't find it anymore. All my lists
>are dead for my own city.

Now yes, but most of the software on ftp sites was made pre internet,
yes?

>>Sorry this is not a moan, just a few thoughts on another point of view
>>at 6am and bored silly :)))
>>
>
>See you next round:-).

Ding Dong!.. ;-)

> controller chip in the Falcon?

I'm just using a standard Epson 1.44Mb in mine, off the shelf. I had to
set the ID Jumper though to be 0 instead of the PCs (non)standard of 1.

It is read before anything else, according to the docs. AFAIK, commenting
the _TSL line out is the same as not having this line at all.

> > > 6. Can't use downloaded desktop icons from TOS - MagiC icons not very

A link is enough. I proceed this way. Very useful with a "huge"
deskicon.rsc and a lot of those little icon.rsc files provided with more
and more programs.

2626. Re: MagiC causes Falcon030 Unstability - Better Multasking OS?

Newsgroup: comp.sys.atari.st
Date: 1998-02-06 00:00:00 UTC
From: drojo@marlin.utmb.edu
Message-ID: <6bg01b$11f$1@allele.utmb.edu>
Source record: 108179

Hi Mike, I have experienced some problems with MagiC at the
beginning, but most of them can be sorted. The boot problems may came from
the HD driver: with a ICD driver I got that "system destroyed" all the
time, but when swith to AHDI the problem is no more, of course if you get
a copy of HD driver will be much better :-). Be sure you are using
Extendos Pro v 2.2b that is the last version (IIRC) and the one that works
well with Magic.
The systems lockups are usually produced by the (old or in
development) applications running, but MagiC itself is very stable (at
least in my falcon) and so it is with well written software. In the case
you cannot get an application to run under Magic, after trying tho run
with the TOS compatibility switch on and in singletasking, then try
another multitasking system as Geneva, Multitos or Naes (I just boot in
plain TOS for that).
About the desktop, is a matter of taste, but you can always run an
alternative Desktop as Thing, Neodesk, Ease or other... but the Newdesk
icons may be used in Magicdesk, just drop the RSC file in the right folder
(I don't remember the name now, sorry) and them will be available when
assigning an icon.
No clue about the slow downs you experience, but sounds bad.

Hope you get your system to work properly...

Daniel.

Mike Saeger (wanda@xnet.com) wrote:
: Sadly, I had to delete MagiC from my Falcon030.

Greeting Atari Users,

Here is an update to our Good Atari Stuff ForSale List.
More items added to list.

ATARI 8-bit items
-----------------
1.*SOLD*

2. SBM Small Business Management for Atari 8-bit Computers
Original disk, Notebook manual, Basic XL cartridge and manual.
Requires 2 Double Density Disk Drives. Price-$15.00

3. Eleven Atari 8-bit software titles---------PRICE REDUCED*
MRCA Mach 2 / original disk and manual.
Wayout / original disk and manual.
Mad Magazine's Official Spy vs. Spy / original disk and manual.
Asteroid Miners / original disk and manual.
Round About / original disk and manual.
Micro Shuttle / original disk and instruction card.
Bill Budge PinBall Construction Set / original disk and manual.
Raid over Moscow / original disk and manual.
Menu Writer / original disk, manual and box.
Cut and Paste / 2 original disks, manuals and folder box.
Music Construction Set / original disk, manuals and folder box.
All Eleven software items for $30.00.

4. Omnitrend's Universe
2 Original disks and Large Black NoteBook manual
Hard to find game. Price-$30.00

5. Atari Remote Control Wireless JoySticks
Original Box, 2 JoySticks and Interface. No PowerSupply.
Intended for use with a 2600 system but will work on Atari 8bit.
Like new. Price-$10.00

6. Atari XDM121 Daisy Wheel Printer
Good condition. No manual or box. Prints well.
Price-$15.00

7. PQ The Party Quiz Game
4 push button controllers, Interface, 2 original game disks,
4 sets of extra game disks, Original manual and box
Like new. Price-$20.00
```

8. Animation Station
Drawing Pad and Pen, Original disk and manual.
Like new. Price-$20.00

Atari ST Game Software
---
9. SuperCars II / Original Disk, manual and box.
Price-$7.00

10. RamPart / Original Disk, manual and box.
Price-$7.00

11. StormBall / Original Disk, manual and box.
Price-$7.00

12. Tetra Quest / Original Disk, manual and box.
Price-$7.00

13. Wanderer / Original Disk, manual, 3D glasses, and box.
Price-$7.00

14. MindWheel / Original Disk and Book.
Price-$7.00

15. Essex / Original Disk and Book.
Price-$7.00

16. Total Recall / Original Disks, manual and box.
Price-$7.00

17. Last Ninja 2 / Original Disks, manual and box.
Price-$7.00

18. R.B.I. Two BaseBall / Original Disk, manual and box.
Price-$8.00

19. Jewels of Darkness / Original Disk, manual and box.
Price-$6.00

20. Damocles / Original Disk, manual and box.
Price-$7.00

21. The Sentry / Original Disk, manual and box.
Price-$6.00

22. Q-Ball / Original Disk, manual and folder box.
Price-$7.00

23. Mortville Manor / Original Disks, manual and folder box.
Price-$7.00

24. Into the Eagles Nest / Original Disk, manual and folder box.
Price-$6.00

25. Cloud Kingdoms / Original disk, Poster instructions and box.
Price-$7.00

26. Monster Pack Volume 1 (includes 3 games)
Shadow of the Beast 1.
Infestation.
Nitro.
All original disks, manual covering all games, and box.
Price-$10.00

27. Zork II / Original disk, manual, box, and etc.
Price-$6.00

28.*SOLD*

29.*SOLD*

30. Beyond Zork / Original disk, manual, box, and etc.
Price-$7.00

31. A Mind Forever Voyaging / Original disk, manual, box and etc.
Price-$7.00

32. WishBringer / Original disk, manual, box and etc.
Price-$7.00

33. SpellBreaker / Original disk, manual, box and etc.
Price-$8.00

34. Perry Mason
The Case of the Mandarin Murder / Original disks, manual and box.
Price-$7.00

35. High Roller / Original disks, manual and box.
Price-$7.00

36. Omnitrend's Universe 3 / Original disks, manual and box.
Price-$8.00

Atari ST Applications and Utilities

A1. Easy Draw Package
SuperCharged Easy-Draw version 2.24.
Super Charger version 1.01.
Easy Draw Font Pack 1.
Easy Draw Personal Draw-Art 1.
All Original Disks and Manuals in the Original NoteBook.
Price-$15.00

A2. Partner ST / Original Disks and NoteBook Manual.
Price-$8.00

A3. PayRoll Master / Original Disk and NoteBook Manual.
Price-$7.00

A4. Scholastic Series Biology Package
For Grades 8-9
Volume 1 Original disks, manual, and plastic folder box.
Volume 2 Original disks, manual, and plastic folder box.

Volume 3 Original disks, manual, and plastic folder box.
Volume 4 Original disks, manual, and plastic folder box.
Price-$12.00

A5. Photo Show Plus version 1.01 / Original disks, and manual.
Price-$6.00

A6. Slicctop / Original disks and manual.
Price-$9.00

A7. Michtron Package
The Juggler / Original disk, manual, and box.
Michtron Utilities / Original disk and manual.
M-Cache / Original disk and manual.
Tune Up! / Original disk and manual.
PinBall Factory / Original disk and manual.
Price-$15.00

A8. Metacomo Make / Original disk, manual and box.
Price-$5.00

A9. Quick ST II version 2.21 / Original disk and manual.
Price-$5.00

A10. PaintWorks version 1.5 / Original disk, manual and reference card.
Price-$7.00

A11. AutoProgram database / Original disk, manual and container.
Price-$5.00

A12. HelpMate / Original disk and manual.
Price-$7.00

A13. Abbreviator ST version 1.1 / Original disk and manual.
Price-$5.00

A14. AND Fast-Key Shell / Original disk and manual.
Price-$6.00

A15. AND Cash_Register / Original disk and manual.
Price-$6.00

A16. ZoomRacks / Original disk and manual.
Price-$6.00

A17. Thunder! version 1.31 / Original disk and manual.
Price-$6.00

A18. ColorWriter version 1.2 / Original disk and manual.
Price-$5.00

End of list.

Well _I_ have been using system 6.03, 6.04, 6.05, 6.07, and 6.08,
with no more problems than usual Mac crashes (experienced on every
system)
I am going to be trying the demo of RAM charger which apparently will
allow 4MB
Mac Plus systems to use system 7.0. it might be kinda slooow :)

Nope, I wouldn't. I'd have to say the opposite! It can easily be
argued C does what it does too well! There's always one more way to
accomplish exactly the same thing. Worse than that, it would be more
correct to say there's (in practice) always one more way to accomplish
nearly the same thing. This can make it extremely difficult to be able
to follow third party sources.

>thus using it to describe
>STOS means you think less of it....

If we were sat in a pub this exchange would take a couple of minutes
'cos we could use all those "ah yes", "hmm", and body language
doofreys that would tell us both we weren't really on opposite sides
of the fence in this particular context!! ;-))

> <FX:SLAP> Choose your weapon sir....

I only think less of it because it it difficult to do anything with it
that it has not been designed to do. In the same manner, I think less
of any language that is subject to the same restrictions. What STOS
has got in its favour, is unlike "those languages", it can do some
things very well, which promptly raises it back out of that catagory!

That's what I meant when I said it does what it does well! :-)))

> DICLAIMER My above posting is a JOKE in response to insinuations that
>I like STOS.........get happy:)

I am. Got 2 cases of Kronenbourg in the fridge! ... <G>

This sounds like you are having a buss error. You might try reseating the GLUE and MMU chips, or you could try the famous Atari drop test. If you can figure it out I do repairs for $30.00 plus parts and shipping. Hope that this helps

>connect the HDD to the ST.
>Can anyone tell me what kind
>of cable is needed ?

Hi there,
You need a cable with 19-pin D-type connectors in both ends. This is a very rare cable and may be hard to find. The 19-pin type doesn't belong to the normal standard unfortunately, but I seem to remember that old Mac's used a similar cable for conecting external disk drives. I'm not sure about it though...
Otherwise you could buy two 25-pin D-type connectors and try to cut them down to 19 pins and solder it together on your own. Don't make the cable any longer than about 30-40cm and make sure that it has a good shielding.

Good luck!

MPEGs are slow because there's a lot in 'em. The trick is to drag over to a
P166 or better <g>

With my limited experience of Nemesis'd Falcons, they're much slower than my
TT, from what I've seen, and I still have the same problem as you with MPGs..

Well, I'm no 'Peter West' but I've given it a go - (use your imagination a bit...) - see below.

mk> I think I understand that last part, that this discussion is
mk> meaningless, but Andreas has still not said if the _FRB cookie is
mk> setup correct or not under MagiC. Uwe says it is but Andreas _have_
mk> said before that it's not and that MagiC uses another hidden buffer.

He seems to be saying that it's more complicated than it might seem, with all the hardware variations, each having different requirements.

I think we need to invent some kind of standard...

=====
On the TT an FRB-Cookie and FRB will always be set, even if it doesn't have any TT-RAM.
As you know the floppy always uses the ACSI-DMA. The FRB is used with every (!) access to TT-RAM. Otherwise not.

Problems come with computers with which the FRB is not set at boot-up, eg: with an ST. If, then, Maddalt() is called, the FRB will be created seperately. That's what I have built in for some of the ominous accelerator cards. Now, recently, somebody came with some other accelerator card and said, that is exactly what brings problems and that MagiC itself should not create an FRB. From that point I am fairly tired of this unfortunate discussion.

A completely different problem is allegedly that MagiC should actually create an FRB with Maddalt (it must share the floppy!), but not enter a Cookie. This is a real disadvantage.

But: The cache inconsistency problem, of course, doesn't resolve itself through this, because you make the FRB non-cache-capable. Because the FRB will not be used for ST-RAM. In any case not for the floppy.

So the whole discussion is completely idle and useless. There are too
many combinations of computer-CPU-disk driver-accelerator card-
RAM-card, that I still have to look through.

It arrived just as you said. Thanks a bunch Nima.
This is a really neat addition to other animation and graphics tools I have. I've already made several movies with just the click of the mouse. I thought that color playback would be slower than the mono shareware version, but that isn't the case. The playback time is perfect and controled. Movie building is very fast too.

Thanks again,

Mike

Yes, I found it through Ultimate Tos Software index - Utils - WWW

If you can't find it I think I still have the exact URL somewhere.

It looks quite good and exactly what I'm looking for. It's kind of an
editor with it's own GEM kurzel for html and talks directly with CAB
to display pages.

I've messed with the rsc myself but screwed something up.

Willard.

When you got cab2.5 then you should have got a nice big manual and
all the PPP connect stuff to get you on the internet.. should all be
there ?:)

MK>
MK> Well I have got a AB040 Falcon with Nova card and it's slow. If I run
MK> in TC
MK> mode it almost useable. You realy need a fast CPU for this stuff.

Hi Magnus,

same thing on my TT with 20 Megs and TC-1208 plus NVDI-for-Matrix. It's about 1 fps in truecolor (display = TINY). In 256 colors I'd say framerate is about 3 fps...
That means we need a 68080 on 200 MHz for 1stGuide?
When using Aniplay on MOV's or AVI's it's nearly real-time on a 320x200 screen, including sound... the CD-ROM drive (4.4 speed) probably being the bottleneck...

> A call for help!

I think the LBP-4 is a Windows GDI printer. This means that the image processing is all done on the host system within the Windows environment. The printer will not work with any other OS and may not even work with the next Windows OS. BE CAREFUL when you buy a printer and scour every inch of the manual and box to make sure that it isn't "ready for Windows" or "designed for Windows." Also, if it will print from a DOS program, but only when run from within Windows, it is a Windows-only printer. I was attempting to compile a list of Windows-only printers to warn people with non-standard computer systems, but the information is very hard to find. Sometimes it's mentioned in product reviews, and sometimes it's not. Computer Shopper has a good product chart, but the companies use their own abbreviations for their Windows-only system. For example, many of the Epson printers have been very good about compatability with DOS and with Macintosh, but a couple of their low end printers now use the Windows system. All Epson did was add a number (ESC/2 I think) to their system description. HP is also very good for compatability, but there is one 800 series printer and their new 11x17 printer that are Windows only. So know for sure whether the printer will work for you before you buy it, or buy from a place with a good return policy.

correct..the stuff is on there, you need to install the software using
the install prg, then you will end up with a folder called PPP and its
all in there, you currently have 2 disks with data folders yes?, when
you install..these will tutn into the folders you need :)

Be a bit of a bugger without the manual though ?... hmmm

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.techNYNNYY

Where do I get copies of the TOS image files?

I have tried using ftp.fata-design.com using 'anonymous' but am refused access, and I can't download them from the little green desktop site.

Is there another ftp or url site.

Thanks

Cheers! for now

Yes they should indeed. I now for this message use Emailer v1.0 dated 1997 Dec 22, instead of the former Dec 14 version. How do the lines look like now in NEWSie? long again?

According P. Rottengatter ASH refuse to do something about it and have a diffrent view how thing should work, but I have to try this version and hope.

It looks good in Emailer and MS Outlook Express.

I really like your X-Hardware: entry in your header. Is this a Okami feature or common in News?

Yes, there are a few improvements but it's still far from completed.
The pages I've make for a local aquarist club looks very awfull with
Wensuite. It seems that lots of html-code are misinterpreted.
Furthermore still no 'animated gif' support, no colored table borders
etc.
Still a long way to go

Hmmm... I've heard this many times but never spoken to anyone who ever tried it... Would it be likely to cause damage?? I wouldn't have thought so myself: it should just be an extra two address lines?

If it is safe I shall try it (i'm getting a couple of 4 meg 30 pin in a week or two for my ageing 386sx)

Any thoughts?

CAB 2.5 is bundled with PPP Connect that allows a PPP connection under a
preemptive multitasking OS (like MagiC) only.

If you do not have MagiC, then you need STiNG and CAB Overlay. That's pretty
much all you need...

TOS images are illegal. Please don't ask for help if you can't figure that
out.

In another post you ask about doing D2D on an STE, so if you have an STE,
you can make a perfectly legal TOS image with the MAKETOS program that's
included in PacifiST (http://www.pacifist.fatal-design.com).

```
THE ATARI ST QUICK FAQ - v2.3 / 1998-01-29
The 'Quick' FAQ was initially intended to be a small list of resources made
to
avoid comp.sys.atari.st newcomers asking the same questions over and over
again. However, as the project progressed, and other members of the Atari
community became involved, it simply became bigger and bigger. I doubt it
really deserves to be called 'quick' any more, but hopefully it will still
serve it's original purpose.

A local pawnshop had the Atari Video Music console for sale. I'm not sure
if they've sold it yet. I wonder what it does? The owner of the store
didn't know.

HARDWARE

1.ST 1040F 1MB ram. This machine has an audio output jack (RCA female)
so you
can plug in to your external ampolifier. No need for pre-amp. It will go
with
hayes modem/cable and the famous beetle mouse!. $50

2. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari or pc.
$30.
(has original PC software)

3.Atari PS for external Disk Drive $8

4.external PS for the 520ST $7.00

5. SC 1224 color monitor. It needs video cable $16 (I can give you one
that needs
a connector at the other end (free).

SOFTWARE:

1. TRUEPAINT V 1.02 $15 Excellent drawing program; all resolutions and
colors. Works in ALL
ataris. From B\W. to true color. Manual available.

2. ICD hard disk utilities Version: 6.2.3 2 disks no manual $10. I will
send a list of the files upon request.

3. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations
audio-video; Also watch
kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol
CD-ROM $15 (Falcon).
Needs Multitos.

---------- NOT ATARI----------
1. SM 57 Shure microphone $ 70. (cable+ desk stand included)
2. Akai Open reel tape, 4ch. $ 50
3. Tascam 4ch mixer(line in/mic/attenuator) +tape recorder/dolby. $30

Free stuff (with the buying of any of the items :) :

Free manuals:
HD Driver 4 rev 1.1 1/96
Deskjet utilities pack v 1.2
Calendar and appointments

Atari falcon AFM; D2D; SAM.
Imagecopy 2
Pagestream 2 quick start manual

- Omnires Monitor emulator for the ST.
-External floppy drive 1DD good case/mechanism.

If interested send ZIP code to ask UPS for charges.. For software I can send it for $3.00 US priority mail. (if you are in the US; I am willing to send abroad also) Regards, Phil.

Yes, it can be done without threads, if you instead have a provision for
asynchronous I/O. This is difficult (if not impossible) to do properly
given the way the AES works. In that respect, I would guess that STING
works about as well as anyone could reasonably hope.

Here's the problem, in a very light treatment. By the way, the exact
same limitation exists in the MiNT environment, because the restrictions
are imposed by the AES, not by GEMDOS or other low-level OS parts. Everything
in a GEM program is event-driven. Most programs use the evnt_multi call to
wait for all kinds of events, (timer, key, mouse, etc.) and process them
as they occur. Unfortunately, the network driver is also a source of events,
but evnt_multi doesn't know about it, and doesn't know how to wait for that
kind of event. So, you *must* use a separate function to detect network events.
This forces you into a tough spot - if you use evnt_multi to wait for GEM
events, your user interface will be responsive, but you won't know what's going
on with the network. If you wait for network events to occur, your user
interface freezes. You can go into a tight loop, polling each in turn. That
will waste a fair amount of CPU time, but it could be done. The STiK/STiNG-
based CAB.OVL could do this. It's a pain though, and would mean rewriting
a lot of the code that calls the API. Instead of having a single convenient
function for resolving a hostname, you'd have to specify callback functions,
timers, and a bunch of other tedious details.

All of this hassle could have been reduced, if the AES had been written to
use real (i.e., MiNT) pipes for AES message-pipes, in the MultiTOS case.
That was the original plan from Eric Smith, but Atari management canned that
idea...

I worked around this stumbling block by using a child process in the MiNTnet OVL. The parent process only uses AES evnt_multi calls, so CAB's user interface is never blocked. The child process sits around waiting for network events. When the child handles a network event, it sends an AES message to the parent, which then processes it in its normal AES control flow. Thus, both GEM and network events are fully coordinated, at the expense of one additional running process.

>I am quite impressed by the description of the MINT/CAB OVL that I

>certain reasons and would prefer to stay with this solution if
>possible. I am sure those that chose to go the other way place a very
>high value on your efforts, Howard, just as I do on the efforts of
>Peter and Dan.

I see your position; I guess you're trading off one source of pain for another. In the MiNT case, installation seems difficult, but the programmer's job is simplified and as such, applications can be made more usable, more easily. In the other case, installation is simplified, but the programmer's job is much harder, and application usability is harder to enhance. Of course from my perspective, there is no installation difficulty with MiNT... I've looked at these MiNT distribution kits, and they seem pretty unnecessarily huge. At least Atari did something right with their MultiTOS distribution - a couple of files, and that's it. Turn it on and it works. Those MiNTOS distributions seem aimed at turning a ST into a Unix workstation. That seems like a misguided goal to me; Unix was never a user-friendly easy-to-use operating system, and it still isn't today. TOS is. MultiTOS is. Yes, because of the added capabilities that MiNT gives you under the hood, you *can* run a lot like Unix, if you want. But generally only *programmers* would want to. Hell, *I* don't run MiNTOS kits...

This were insane, as all benefits of DMA were lost, additionally to a serious
slowdown. But then again, a lot of parts in TOS were done in insane ways.

>> Now my own on this : ;-)

Have you read what I wrote ? Your wording looks as if you just ignored it !

I said all ST-RAM must be marked non-cachable, except the MagiC code. This
must be done *after* MAGXBOOT runs. Now tell me why

> This will not work as MagiC creates the buffer somewhere and you don't
> know where.

What has this got to do with the FRB ?

The _FRB cookie is not at all needed for it, in no way ! And if you do it
the way I said, the MagiC code is cached and will therefore *not* run slowly.

> Hehehe... sure, no problem. It's nice then people try to help. You did
> treat
> Andreas more friendly than some other persons who has written here in
> german
> though. ;-)

A little bit maybe, yeah ;-)

It's a lot different, if someone tries to help, and has trouble writing english for several paragraphs; or if someone asks a question that is barely two lines long. English is taught in school in germany, and while I can well understand the pain of writing a tutorial in english (my english was hopeless too at school), it shouldn't be too hard to construct a single sentence (nobody requires proper grammar, after all). And usually Andreas uses english here.

> I don't think so. You (actually Andreas trough you) said above:
>
>> Allegedly there is the problem that MagiC creates an FRB at Maddalt, but
>> does not create the cookie. This is a real bug.
>

No, that's wrong. At least for the proper solution, the cookie is completely irrelevant.

This is certainly a great thing, but it's possible only because you used
multi-processing on the CAB.OVL side I believe, or you used the CAB API in
a better way. I doubt Dan Ackerman could be talked into either of them.

Any way, compiling your CAB.OVL with my BSD-Lib for STinG is gonna be the
ultimate test for the latter.

BTW Howard, I understand the connect() blocks on stream sockets until the
connection is established. There must be a way to make it non-blocking ?
How would you do that ?

> Hmmm... this is a very big "design flaw" if you ask me.

It's been dictated by the very limited computing power at the time GEM was
designed. The method chosen simply requires less resources. Remember in early
days GEM was meant to be run by 80286 machine !

> to window meesages. Under OpenWindows this is not a problem as the
> iconify
> button is a part of ths "OS" and therefor always works. Only redraws of
> the

Forgive me if I confuse anything, but wasn't OpenWindows some library and
window manager for X-Window ? So your statement is correct, and is not. Note
such things under X are handled by the window manager, so for this situation
the window manager happens to be the application. If the window manager is
frozen under X, you cannot move, size or iconify windows anymore.

> windows insteed of just icons for iconifying. But MagiC now supports
> window
> shading. Does this still work whatever the application is "alive" or

> size events should be possible. This would be nice features if you ask
> me
> and it should be possible, I think... Andreas?

This is hardly sensible. The paradigm of GEM is that all actions are under
application's control. The application clips it's text output for instance.
Now the AES 'forces' iconification, but the applications isn't aware, so it
will paste it's text over the desktop, where the window was before. This is
nonsense of course.

Similar for 'move' and 'size' actions. For these, there is the additional
drawback, that the program might have good reasons to allow only certain
sizes and locations. The AES will not know these, so 'hard'-moved or -sized
windows will create chaos.

>> way were doing the network access via some thread under MagiC 5. I've proposed

Sure, the older method has to stay in place. I thought this is obvious.
CAB had to check the OS, and decide which method to use.

> is that MagiC threads are not compatible with MiNT threads (or the other

Sort of wrong. MiNT does not support threads.

>> You should have access to the desktop, so you can launch other programs.

> you can toggel realtime moving/siezing/scrolling of windows.

This is completely different, as it does not require a change of paradigms.
BTW. there is only realtime scrolling, no moving or sizing ! While realtime
scrolling, MagiC just sends VSLIDE messages all the time, while TOS would
wait and only send the final one of the messages. So the application feels
at home, from it's point of view the user constantly moves the slider by
just one pixel and releases the mouse button again, then click again and
move another pixel etc.

> hours?

Have you ever seen the specification of BSD sockets ?

The difficulties are not getting the declarations of the functions.
The difficulties arise from the tiny details of the behaviour of the
functions which I need to model and which are nowhere documented. I'm
no expert on BSD programming after all. Another difficulty is that
a few things need rather awkward constructs with the current API. I
want to add a few things that will make a better solution feasible.
However I do not want to do these things simply on my own, so it needs
discussion with the other people from the developers mailing list.

> that would work with Adamas

This seems to suggest that you read my paragraph on APIs and libraries
again ;-)

I was not after writing a replacement for the Draconis API. Maybe it's
not even possible, this is if the API is not documented. (AFAIK the
Adamas source code is not available ?)

But that is purely a problem of your machine (well, a problem in XaAES of course, but that's not the issue), all four Ataris I have here run XaAES very well (apart from the known problems). I do not know if the machine of that guy will behave like yours, or like my four machines, but from my experience I know there is definitely some likelihood that he'll like it.

> Reccomend something that isn't in a LLOOONNNGGG way finisihed is a bade

> if you ask me.

Ok, but why do you recommend MultiTOS then ? It's got so many bugs, the need of fixing all those put MultiTOS just the same LLOOONNNGGG way from being finished.

(But as I intended to avoid mentioning MultiTOS here any longer ... ;-))

> And from _my own_ experiences MultiTOS works but XaAES
> doesn't.

See ? Mine is exactly the other way round. And it's not just mine. It's the experience of most people who ever tried to develop system software for MultiTOS.

(Shit, there is that bloody word again ... ;-))

> I guess you have got a super Atari which loves everything except
> anything which
> has TOS in the name.

Isn't that a bit silly ? I got TOS in ROMs, and even on my developing machine I use it occasionly (without MiNT usually). The other three machines have never seen anything apart from TOS (and occasionly MiNT).

You'll definitely gain from it. The buggy TOS routines can lock the port,
or cause lost packets (which will be retransmitted so it's not too easy
to realize this problem). And, efficiency is increased a lot.

OK, it now shows start at 2: fingers crossed!

>fire it up manually under MagiC and you can at least get at your cpx's.
> Does it behave itself this way?

At first, no: I renamed every CPS and ACC and AUTO PRG before trying
XControl again. It bombed every time. BUT...
having tried everything I could think of, with your encourgement:-
lo and behold! clicking on a copy of XControl in another folder (with
ACX) it magically appeared again. YIPPEEE!!!!!
Only thing remains is to reboot, which I haven't dared to do for days!
And see what happens next.....

The copy of XControl was identical in length with the one I use,
but this was obviously corrupted. I had even downloaded a copy from --
I forget where -- but it was a German version 1, no use. Mine is v 1.31.

Thanks, Guy, for your replying: you were the only one to come to the
aid of this party. Lang may yer lum reek!

Hello ST fans !!

The 14th issue of the French diskmag TOXIC MAG has been translated
into HTML format last week, so you can have a lot at this URL :
"http://www.chez.com/toxicmag/"

OK, so bad the articles are mainly in French but I (the editor) didn't
wanted to translate over 1,5 MBytes of ascii text ! :)

May the TOS be with U:\ !

AFAIK it was released on it's own. I've a copy of it on the November 94
coverdisc of 'ATARI ST USER'. I've seen it at a couple of FTP sites as
well. Not sure which ones though.

ROTFLMAO:). Love your sig!
Ok, I always found that MPEGDSP played the files I create with Sparkle
on the Mac to play at normal speed on even a standard Falcon. I could
make up some examples (not with Pamala however) just for a few to
test.

Message-ID: <19980207053201.AAA24151@ladder02.news.aol.com>
Source record: 108117

Make use of those MIDI ports on your ST!

Proteus 1, 16-bit high-res samples, 32
voice polyphony, 6 outputs, headphone jack,
used very little, comes with Master Tracks Pro
and Band in a Box software, shipped to you
COD, $275.

Some info on the Proteus:
192 fully programmed CD-quality preset sounds:
Punchy brass, electric guitars, pulsing latin
percussion, plus many more high-energy sounds
for your live or studio projects. 16-bit high
resolution samples for realistic sounds, 32-voice
polyphony to produce rich variations and depth,
and 16 MIDI channels to create diverse compositions
and sequences. The Proteus also has 6 polyphonic
outputs (three stereo pairs) for comprehensive and
flexible mixing capabilities. Up to three
simulataneous footswitches pper preset may be
programmed. The Proteus has the industry's clearest,
most straightforward user interface. Create hundreds
of custom sounds simply by combining or altering
samples and presets, or use its 56 raw digital
waveforms as material for an unlimited range of
entirely new, CD-quality sounds.

Steve, boy would I ever love to get my hands on Ultima 6! I've been offering $50 for a used copy (complete with docs, and no pirated stuff!) for about 2 years now...Haven't found a taker yet... ;(

Try Al Hortons Computer Dungeon or CeeJay Software for the other titles though, I know they've got some Ultima 3-4-5... I love this RPG series, and wish 7 had been ported to the Falcon... Good luck, and see ya! :-)

CAB has started acting strangely tonight. NO matter what URL I enter
it comes back with Error #-1, almost instantly so I can't believe it's
really trying. What makes it stranger is I _can_ connect to the
site of the commercial pagecounter I use on my home page.

What's happening? The manual doesn't list any error codes...

2709. Corsair: new Falcon game

Newsgroup: comp.sys.atari.st
Date: 1998-02-07 00:00:00 UTC
From: Reine Larsson <d4reine@dtek.chalmers.se>
Message-ID: <6bheej$9kv$1@nyheter.chalmers.se>
Source record: 108124

It is finally here!

CORSAIR is an action game for the Falcon030 developed by IMPULSE.
It requires 4Mb RAM and works on both RGB/VGA monitors and TV
(RGB is recommended). Graphics resolution is 320*240 in 16bit
HiColour. Programmed in 68030 assembly language.
Download now from web page below!

* Corsair web page:
http://www.dtek.chalmers.se/~d4reine/impulse/corsair.html

* Impulse web page:
http://www.dtek.chalmers.se/~d4reine/imp_hp.html
(new and improved!)

Questions?
Send email to d4reine@dtek.chalmers.se

If you don't have access to WWW, I can send you the game by email.
It is also available on ftp.

/Regards,

Reine Larsson (Longshot/Impulse)

2710. Atari Falcon030 setup for sale (UK only)

Newsgroup: comp.sys.atari.st
Date: 1998-02-07 00:00:00 UTC
From: ivan@recursiv.demon.co.uk
Message-ID: <886849025.1036910599@dejanews.com>
Source record: 108125
Cross-posted to: comp.sys.atari.st,uk.adverts.computer,demon.adverts

COMPLETE FALCON030 SETUP FOR SALE (UK ONLY):

Hardware: (Everything works fine BTW)

Computer: Atari Falcon030.
Fitted: Nemesis accelerator board with RGB/VGA switch. And FPU.
Speed: 24 MHz CPU & bus. 48 MHz DSP & FPU.
Memory: 14 Meg. (ie. one 72-pin 16 meg SIMM).
HD: Half Gig internal IDE.
FD: 1.44 Meg internal.
TOS: 4.04.
Extras: Atari adaptor to allow connection of VGA monitors.
SCART lead to allow connection of RGB monitors.
Mouse & mat.
Mouse & joystick port extension leads.
Video Master digitiser & sound sampler
Colour Master RGB splitter
The old 4 meg daughterboard

Software: (Everything comes complete with original boxes and manuals)

MagiC v5.11
Devpac
Devpac DSP
Lattice C v5.5
GFA Basic v3.6
Videlity
Apex Lite
Llamazap

Loads of P.D. & shareware stuff

Some old ST games that work on the Falcon:

Virus
Dungeon Master
Chaos Strikes Back
Civilisation
+ others

Loads of unindexed backup disks containing
hundreds (thousands?) of Falcon programs, demos,
source codes, games etc, taken from the
internet over the last three years or so.

A real lucky dip...

And I'll throw in a box full of old ST games
that may or may not work with the Falcon (via
one of the many ST emulators) ie. they are untested.
Use them or give them away or use them with an
ST emulator on another platform.

Books: Atari Falcon030 Service Guide (pretty rare I think)
M68000 Family Programmer's Reference Manual
680x0 Programming By Example
MC68030 User's Manual
DSP56000/DSP56001 User's Manual
The Atari Compendium
ST Internals
GFA Basic: Advanced Programming

+ all the original Atari manuals, disks & docs

Mags: Every issue of "Atari World"
Every issue of "Atari Computing" to date

Extras: The above list is all 100% confirmed but I
wouldn't be surprised if I've found even more
stuff by the time I get round to parcelling
everything up. Any extra stuff will just get bundled
up with everything else - it won't affect the overall
price stated below. And I'll forward anything that
I find later too.

Price: I've thought long and hard about this. I reckon I've
spent well over three hundred quid on hardware & software
for this setup just in the last 18 months alone. God only
knows how much I've spent in the two years prior to that,
but it was a lot! And all that expense was on top of buying
the actual Falcon itself. It's pretty much a complete setup
now, with more than ample reference material, software and
miscellaneous other goodies. And it remains expandable (the
Afterburner accelerator looks wonderful).

I'm asking 600 pounds (o.n.o.) for the lot. And I'll pay
for insured postage to anywhere in the UK. I don't want to
split. It's everything or nothing I'm afraid. Anyway, email
me on...

ivan@recursiv.demon.co.uk

...if you're interested.

Hi Peter!

Then you will not reply to this message...

The Emailer uses a inbuilt feature that filtrates messages like mine here. Maybe you should buy the product?

This message is sent by a Atari app on a Atari operating system, through a Atari TCP/IP stack on a Atari Falcon. All, except the computer is delivered by ASH.

I just moved my P166 to my daughters room, 'course I now have a complete fully functionable Atari platform. She will play Pippi Longstocking on it.

Souds like an oldish machine which has probably been flexed and
twisted in its time. This gives rise to the common problem of some
socketed chips working loose.

You CAN just try dropping it onto a flat surface from about 2"!

Or you can undo the six screws in the square holes at the bottom.
Remove keyboard plug, remove shielding and the push home all socketed
chips.

The game is called "Midwinter II: Flames of Freedom". Nice game, and much better than the first, though I haven't played it that much.

That's the down side of running an Atari business: you just don't have the time to play with all the goodies that come in. If only we could figure a way to make the day 41 hours long.

I was wondering if anyone has any information on Top Byte Software? They were a business in England that dealt in ST games and released "STario Land" and "STario's Christmas" about a year and a half ago.

I was interested in obtaining more copies of those programs to sell to my customers, but the phone number I have is no good and the letter I sent to the address I have was returned.

If anyone has any info on Top Byte (are they still in business?) or knows who now has the rights to STario Land and STario's Christmas that I could contact to see about purchasing these titles I would really appreciate it.

Thanks in advance!

Well, this is strange. I've tried running a completely clean setup
with no other autoprograms or accs, with and without hsmodem07 (with
different configurations of SCC.PRG), with and without the modem.cpx
but always the same error from ConNect: "Fileerror: Serial port, null
T0 unknown error".
But when I installed Fastser096 instead of the hsmodem drivers ConNect
recognized Serial2 fine.
Am I the only one with this problem...?

mc> I missed the beginning of this thread. But as I understand it the
mc> original question was "if you have a Falcon and you enable
mc> Background DMA in HDDriver with Magic (> 4) does it really work or
mc> does it cause problems?"

Actually, I started the thread, and that wasn't what it was about, really. I
pointed out that CAB's serial transfers are much more efficient on my Falcon
with background DMA turned off, even though I'm not even using the SCSI port
while online. This could at least partially because I'm already taxing my
Falcon by using 768x480xTC while online.

But yeah, background DMA *does* work, though many have suggested that a
general sluggishness (even when not doing anything else in the foreground)
defeats its purpose on a stock Falcon.

Never had this happen even once.

w> 2. Extendos became unstable - not always to access CD-ROM drive

Latest version of ExtenDOS Pro works great for me.

w> 3. Boot problems - get message **System Destroyed** messages.

I don't think I've had this problem, but I *have* had TOS 4.04 bomb
occasionally during the boot process for no apparent reason.

w> 4. Desktop not as good as TOS - Can't assign function keys to Icons

But you can assign them to function keys via the Options menu. There are
also many other things that the TOS desktop doesn't have. In any case, there
are other options available, such as Ease and Thing.

w> 5. Unexpected system lock ups

Possible with some poorly written applications. Of course, the same thing
can happen with TOS 4.04.

w> 6. Can't use downloaded desktop icons from TOS - MagiC icons not very
w> good.

Yeah, you can. Just drop the file in your GEMSYS\GEMDESK\RSC folder.

w> Is there a better multitasking OS for the Falcon030 that is more
w> stable than MagiC or might there be problems with my installation?

Probably not. MagiC is where it's at, AFAIC.

Are you using at least MagiC 5.11? Earlier versions of MagiC were not very
Falcon friendly, from what I understand.

In article <34db9386c152c0@littlefort.com>,
bbeck@littlefort.com (Brad Beck) writes:

> As a matter of fact I have read the STiNG documentation many times, including
> the programming documentation as I am writing a client.

In that case, I find it very hard to comprehend that you should have missed
(or ignored ?) the bits explaining what's going on about privilege violation
exceptions. They clearly say, every program that appears to make STinG cause
privilege violations should either be patched to cure it's illegal actions
messing with the privilege violation vector, or simply be run *before* STinG.

> All the MiNT documentation I've ever read also states that MiNT should be
> run last in the auto folder.

I've read that sentence too, and all I can say about it is that it's dangerous
nonsense, at least as long as the MiNT developers do not learn to deal with
system vectors properly.

System vectors are a unique resource in a computer system, yet MiNT thinks
it is allowed to grab them all exclusively, unlinking all handlers that linked
in before. This is dangerous and can cause huge instabilities; not with every
other software it's as obvious as it is with STinG !! Sometimes the unlinked
handler is not needed for a long time, and then suddenly an apparently utterly
inexplicable crash happens, because it was needed, but not there anymore, since
unlinked by MiNT at boot time.

Regarding MiNT, this is untolerable behaviour, as there is the approved by Atari
standard of using XBRA, which allows proper handling of vectors. MiNT is after
replacing the original TOS handler that would draw eight bombs on privilege
violations. For that end, it simply otherwrites the system vector with the address
of it's own handler, unlinking the STinG handler too ! What it really needed to
do is walking the XBRA chain until the last entry, and then overwriting the saved
vector in the last entry, which is most likely to be the TOS handler address.
This were safe and proper handling of the issue for MiNT, and it would not unlink
other handlers from the chain, the necessity of which MiNT cannot determine by
itself.

But this is a clear bug in MiNT that exists in all versions of it, and which
the MiNT developers are apparently refusing to fix. :-(

> Sorry for have causing you so much anguish Peter.

Sorry for probably having overreacted a bit. But this is one of the two issues
that are done wrong again and again, and people are blaming STinG for something
that is due to some misconfiguration, which is elaborately explained in the FAQ
(Frequently Asked Questions) part in STING.HYP.

Cheers Peter

Read carefully. I was talking about e-mail, not news. While usually I'm doing
my e-mail via Telnet connections (where long lines are a pain), I have no
reason to do that with news too. (The latter not meaning I'd approve endless
lines in news articles).

> The Emailer uses a inbuilt feature that filtrates messages like mine here.
> Maybe you should buy the product?

Stopping blaming it for not obeying standards, and buying it, are two
entirely different things. I'd say it's ok once standards are recognized,
but for buying it the least it needed to do is running with STinG.

> This message is sent by a Atari app on a Atari operating system, through a
> Atari TCP/IP stack on a Atari Falcon. All, except the computer is delivered
> by ASH.

Rather pathetic isn't it.

> I just moved my P166 to my daughters room, 'course I now have a complete fully
> functionable Atari platform. She will play Pippi Longstocking on it.

Then maybe you should move it back. Windows e-mail clients at least conform to
Internet mail standards. Until the Emailer does that too, you have no fully
functional Atari platform. What about IRC on your "fully functional" platform
BTW ?

I do not understand that. On your web page you're advocating STinG, but here
you're praising ASH ?

Cheers Peter

I know that, and I think I knew that too at the time I wrote that. It's
been the sort of question one would ask in a speech, knowing that the
audience know the proper answer. ;-)

> Well that's all :) you did your job of writting pretty good docs, now
> let the user do a good job at reading them ;)

They are far from being as complete as I'd like them to be. Maybe that too
causes people to skip the important parts.

> Furthermore still no 'animated gif' support, no colored table borders
> etc.
> Still a long way to go

I got some replies recently on my inquiries regarding running Wen.Suite
with STinG. They told there won't be any version that runs with StinG.
On my argueing there are more client available for STinG, I was told all
important services are intended to be built into Wen.Suite. Of course
this did not convince me, as STinG does some things the Wen.Suite stack
most probably never will, so I explained in more words why a version
using STinG would still be uttermost desirable. I'm waiting for another
reply, but I'm less optimistic now than I started.

SC> Does anyone know what the specs are for the TT battery. I have a

Option 1
Some hearing aid devices use a 3.6V battery. Try finding one of these...

Option 2 (this is in fact how I got my clock going)
Buy a battery-holder for 3 or 4 penlight batteries (preferably type AAA, but AA will do too), you only need 3 penlight batteries. Remove the original battery and cut off the wire close to the battery.
Solder the wire on to the + and - of the battery-holder. Make sure not to switch the positive and negative poles. If you use a 4-battery pack you also have to modify it in such a way that it will work with only 3 batteries in it.
Place the connector back on the motherboard and stick your battery-pack on the back of the TT (this way it is easy to change them next time).

Ok, I was residing on another planet when these programs were being developed:-).
What is the lastest version of GEMView and can I pay a shareware fee and get a
key for it?

I have found Gemview useful.

How do I find and register the latest version of 1stGuide?
I have an early version that I just downloaded from UMich but the documentation
just tells you what it supports, not really what it does. However I did try
that version with some of the Mpegs I just got and I guess I need a newer version
than this one. I hope the registered version has good documentation.

I believe I will be supporting M_Player too.

>
>The IJG command line tools will do that, too.

What is IJG? Is this the International Jpeg Group? What is the latest version
of it?

Well, after leaving my cave since I am on the subject.

Here are the Shareware items that have caught my attention.
Any input from users would be appreciated.

Photochrome - Is there a later version that scrolls the screen?
Speed of Light - I would like to get a key for this does it still exist?
Gemview - Same.....
ST GUIDE - What is the latest version of this program and where do I
find it?

>
>Regards,
>Guido

I guess, I am looking for your latest versions of 1ST guide Guido and what
information you can give me on Gemview.

Howdy Howard,

Well, it's a bit much to ask, but I would like to know if you could get
STinG to work with MultiTOS/MiNT. I'm using MiNT1.14.6 with MultiTOS and
I get a bus error with STinG when I try to use any STiK client. STinG's
ping prg works once connected, but resolve prg or any others get the pid
bus error. I'm hoping that it's my mint conf's that's a problem, but I
need a MiNT expert to give it a try. Peter has made it VERY clear that he
has no interest in using MultiTOS, so it's not fair to ask him. All my
regularly used prg's work with my MultiTOS/MiNT setup, so this may not
be an easy task. A hack of some sort may be needed.

If you can get it to work, please e-mail me. It would be appreciated to
know if it's possible on not. I've tried for a long time to get it to work.

>do have a ISP with a PPP account.

Well, CAB 2.5 comes with its own TCP/IP stack and dialer - ICONNECT.
You should be able to configure-up and away you go. You may need to
stick HSMODEM in to make the port well behaved.

OR ... you could use StiNG as the stack/dialer but you would then need
to replace the CAB.OVL released with CAB 2.5 with Dan Ackerman's
CAB.OVL.

For news/mail you can buy the ASH stuff to work with ICONNECT or grab
Newsie which works with STiNG.

>properly.

There is nothing in the page to stop cab loading it, its just been
saved as Shtml, this page has been made using MSWORD7 and thats how it
saves it, if the author simply changes the extension to html or htm
then it will work just the same and atari people will be able to visit
it,

Dont it piss anyone else off the way people advertise there atari
pages in an atari newsgroup, but dont make the page atari friendly ??

Hi Tim,

I used to have SMPTE-TRACK, but have since sold it and got EDITTRACK 7.01 (runs on the Falcon). Same thing, but without all the tape-sync capabilities. I also have Logic Audio and all the SMPTE hardware for that, so I didn't need to duplicate that feature. I really like SMPTE/EDIT Track for the way I sequence. As far as being able to use the SMPTE hardware with Cubase... I doubt that you can. I think it is a Hybrid Arts specific item. I don't see how it would hurt anything to try, tho. One of the leads goes to a joysick port (under the keyboard), and the other goes to the modem port. Also, I don't know if that item will work on the Falcon. I never got to try it out because the version of SMPTETRACK I had (prior to 7.01) didn't run on the Falcon. I would suggest: if you don't have the SMPTETRACK program software, find someone that does, and get a copy. Your SMPTE hardware also acts as the copy protection dongle, and will allow you to run the program. Actually, you SHOULD already have the software if you have the hardware, they were not sold separetly. If not, hmm.....! Do your sequence with cubase, save it as a midi file, and import it into SMPTETRACK, and presto! (Hopefully). If this isn't very clear, or you have other questions, give me an email and I'll try to help.

Good luck!

Brian Van Tilborg wrote:
>
> Ok, I was residing on another planet when these programs were being developed:-).

You were not alone, apparently ;-).

> What is the lastest version of GEMView and can I pay a shareware fee and get a
> key for it?

Sorry, I canï¿½t tell you that since I donï¿½t use GEMView anymore and the author
abandonded the contact and cooperation due to differing development standards.

> How do I find and register the latest version of 1stGuide?

Ever tried Altavista? Simply searching ï¿½1stguideï¿½ will pop up the 1stGuide
Homepage directly (itï¿½s http://www.esc.de/homes/guivol/1stguide/ or
http://workaholics.net/~guivol/1stguide/).

Apart from that, there are several references from important standard
resource sites on the Internet.

If you are interested in any MPEG information, you should absolutely visit
MPEG.ORG, the Reference Website for MPEG, and particularly

http://www.mpeg.org/index.html/MPEG-video-player.html

I have a good contact with the maintainer of that site and MPEG Committee
member, Tristan Savatier.

If you want to use JPEG, you should absolutely read the JPEG-FAQ at

http://www.faqs.org/faqs/jpeg-faq/

Thereiï¿½s another reference to 1stGuide in the Atari section
(see http://www.faqs.org/faqs/jpeg-faq/part2/section-10.html).
And I have a close contact with the author of this FAQ and organizer
of the Independent JPEG Group (IJG), Tom Lane.
The upcoming IJG software distribution (v6b) will include some
features which I contributed and developed together with Tom Lane.

If you are interested in actual lossless image format standards, you
should absolutely go to the PNG Homepage at http://www.cdrom.com/pub/png/
and particularly

http://www.cdrom.com/pub/png/pngapvw.html

Netscape 4.04 does support PNG natively now, so itï¿½s starting off
getting broad acceptance. (And the PNG Group will make sure to
contribute further support for the upcoming Netscape 5 with open

source code...)

So that should only show what I partly tried to achieve with the
1stGuide development: Making available reasonable common developments
for the Atari platform.

> I have an early version that I just downloaded from UMich but the documentation
> just tells you what it supports, not really what it does. However I did try
> that version with some of the Mpegs I just got and I guess I need a newer
> version than this one.

I once tried to upload my software to Umich, but to no avail :-(.
The guys seem to sleep there, and the Atari archive is hopelessly
outdated. So it seems to me that the Atari community in general
still resides on another planet (to speak with your words ;-),
which is the reason that you doni¿½t see me talking too much here.
I do *not* want to reside on another planet, but I *do* want to
spend useful contributions to reasonable common developments.

Unfortunately, it seems that I no longer can associate this intention
with the Atari platform, due to the "residence of their users on
another planet".
Please note that this is no negative attitude against anybody, as was
impudently assumed by an ignorant guy in this group (and Ii¿½m an honest
and experienced enough Usenet participant to not step into a useless
flamewar with ignorant people...).
It is only my personal experience, not negative nor positive, only my
subjective, though real, observation.
The positive aspect is that I clearly say what I think and I want you
to think it over. You could prove me wrong eventually :-). But I doni¿½t
expect that :-(.

> I hope the registered version has good documentation.

Depends on your support. I believe the package to be useful anyway,
and the doc could be improved certainly. But we need to reside on a
common planet therefore ;-).

> What is IJG? Is this the International Jpeg Group? What is the latest version
> of it?

See the pointer above.

> Photochrome - Is there a later version that scrolls the screen?
> Speed of Light - I would like to get a key for this does it still exist?
> Gemview - Same.....
> ST GUIDE - What is the latest version of this program and where do I
> find it?

Sorry, cani¿½t use any of those for my actual work (again the planet...).

Right, - most of it. CAB load this page just fine. SHTML is to tell the server
there is another doc. associated with the first one.
Something to do with, f.ex. a name and adress that appear in all pages.

If you use something as #INCLUDE FILE="name&adress.html" everytime you want that name to appear, and make a file with the name and the adress and nothing more. No head or body tags, only the filename "name&adress.html".

Then you only have to change the name and adress on one page, and the rest is changed also.

cheers Joergen

Problem is now sorted out:
Installing MFP_TT cured the errors in ConNect. This is the driver for
the Serial1 port, but obviously it also has some influence on how
ConNect handles the Serial 2 port...

>Right, - most of it. CAB load this page just fine. SHTML is to tell the server
>there is another doc. associated with the first one.

CCSS or CSS Cascading Style Sheets, set a few variables and all the
pages take the same style, used mainly for the layout, text and
colours etc, so everytime you use H1 it uses x size, x font and x
colour, H2 and a different set, save re writing, all html files can
use the one style sheet by calling it sort of thing, nice concept but
seems to me to be for real proppelor heads, I write my own html in a
text editor, but would still take some convincing to use it..

But as we agree, cab will still load them if the authors would change
the file extension.. hmm and I still say its annoying that people make
ATARI pages and announce them in ATARI newsgroups but not taken one
ounce of effort to make the atari friendly, even none usable by
atari....

Style sheets are not new for html, but because netscape 4 decided to
support them as well, then they are taking off and more people are
using them...hmmm 2 browsers say yes and it becomes
standard....pah!...

<smile>

I have found that on one occasion, one of my font files was
corrupted, and examining this file, I found embedded within
it what looked like a NEWSie log file. The font file was in
a different partition completely. It must be handy to have an
EZ cart for on-line use, and avoid this potentially hazardous
complication of an otherwise excellent program.

>whenever I tried to run a program, or even view a text file, the computer would go down, with what looks like two bombs flashing briefly before the machine resets. What could this be and is there any simple remedy to this problem?

>>Souds like an oldish machine which has probably been flexed and twisted in its time. This gives rise to the common problem of some socketed chips working loose.

>>You CAN just try dropping it onto a flat surface from about 2"!

Did that.

>>Or you can undo the six screws in the square holes at the bottom. Remove keyboard plug, remove shielding and the push home all socketed chips.

>Did that.

> Now the machine just shows flashing horizontal bars on a white (or white with light blue) screen. Any rememedy to this?

Well now that you did all those things to your trusty ol Atari is it a wonder that it is acting a little bit crazy! First of all dropping it isn't the proper way to fix it, though sometimes it does reseat the PLCC chips back into their sockets. This by no means is a true cure for the problem, just a simple fix for the meantime. It also may lead to other board problems or even fracture the PCB itself. Dropping any electronic equipment is not really a "CURE". As for the new problem that you are seeing tells me that you are either having a problem with the MMU or the GLUE chip on the system. (Actually the two bombs show that the GLUE chip has asserted a bus error or the CPU has detected and error) Since you have removed them and reseated them I am assuming that you have taken the time to clean the contacts on the PLCC socket(s) ? If all else fails, I can look at it for you and repair it. I charge a FLAT $40.00 plus shipping to fix any of the older 520/520FM/1040/1040FM computers, and all models of the 8-bit line. This will include any chips and keyboard mylars. It does not cover floppie disk drives or the power supply or replacement of the keyboard. I can work on system that have been modified for a slightly higher price. I warrant all repairs for 30 days from the date of return. If you would like me to take a look at it for you drop me a e-mail at >> dwmoar@aol.com

is no problem (except after the transfer, Newsie dosen't ask for the
new directory the way Solaris wants it to, and the connection is
broke). FTP use to work for me fine on the Solaris machine, but they
have made some changes that involve symbolic links within the server
that are invisable to me. I think this is where the problem is as even
Fetch on the Mac has given me some trouble. I guess security is more
important than compatibility. Someone needs to throw a pie in their
face.

I worked with the NT provvider on this one too. I am able to upload to his
Linux box without problem. He played around with Serve U FTP, but
there were no options to turnoff the ALLO detect command. I can upload
files that are only about .5K, but much over that and it dosen't make
it.

If the laser has HP emulation (most do) then you can drive it with HP
drivers, which are readily available with most modern software.

Out of the ether, the following was mentioned by
guy@swampdog.demon.co.uk...:

g> So did I. I am just assuming the statement is true. Yes I was
g> under the impression Hisoft wrote it but that was years ago. Who
g> knows how held the licence originally and how it may have changed
g> hands?
Well Lattice originally developed Lattice C, but Metacomco produced the Atari
port. At the time Metacomco were selling Lattice C HiSoft was selling the
Aztec C compiler (was command line driven (Gulam) rather than having an IDE
which Lattice had even back then).

Later on when Metacomco pulled out of the market HiSoft took over Lattice C
which was much better than their own product and started developing it.

Now I bet you always wanted to know that! ;-)

2775. Supra Atari Drive seems scsi aware, Zip friendly?

Newsgroup: comp.sys.atari.st
Date: 1998-02-08 00:00:00 UTC
From: shall@oregon.uoregon.edu
Message-ID: <886971310.277676038@dejanews.com>
Source record: 108025

I have an Atari STE with 4megs. I also have a Supra Atari Drive, 50 megs that shows scsi 1 lun 0 when booting up. It also has a scsi connector on the back of it. I have plugged my Zip (scsi) into it, but the computer didn't recognize it. If I get HDdriver, will I be able to use this drive connection? Or should I also get Link97?

>(or white with light blue) screen. Any rememedy to this?

Oh dear! I have not seen this before.

The 2 bombs you were getting were an indication of a bus error which
means that there was something wrong with the memory sytem on the ST.
Re-seating the chips (most importantly the GLUE chip) seems to have
made the problem less diagnosable. Pity - the tecnique I described
usually does the trick.

Ok. Let's concentrate on the bits that matter.

If you have done the re-seating bit I recommended before you will have
done all you can with the DIL chips. (The chips with 2 rows of pins).

So now focus on the square custon chips, there are probably 2.

Remove the 2 spring retainers on each chip. Ease them out of their
sockets carefully. Using a plastic tool ease out each leg of the
chips. Clean these with alcohol. Re-insert.

Believe me! You don't have a big problem. It's just old age and
corrosion.

You are doing PPP aren't you? Have you entered PAP ID and password in
the Dialer config? If you get connected the next thing that happens is
that your ISP tries to verify who you are before allowing connection.

Yep! It's fun alright! It took me a while to get SLIP on STiNG. But
then it was one-shot to move to PPP. When I got CAB 2.5 with ICONNECT
I just repeated my STiNG config data in the ICONNECT dialogues and,
again, it was one-shot. There must be something very educative about
getting the first connection , after that it seems to be
plain-sailing.

>Maybe I should let it sit a day or two
>and than go back and look again.

Ha! I have sometimes found that HD drivers crash all over the place
until I do a real switch-off and restart but I don't think that TCP/IP
stacks are like that :-) You must really have something wrong. ....
Not very much ..... but enough :-)

Whenever I have wanted full ANSI I have used the MYBLUE font set. It's
bit mapped so has to be entered in ASSIGN.SYS. I have just tried to
send it to you but, for some reason, Newsie will not UUE it :-(This
has happened before but I haven't mentioned it to John. If you can't
find MYBLUE elsewhere give me a shout and I'll try to get it to you
some other way.

I don't know os an Sm125, but the SM124 is a monochrome monitor. If it works fine on two 1040's, and not the mega, then I'd say its the Megas fault. Probably the monitor port has a bad solder connection, or the chip handling the monochrome detect is bad. Trying a different monitor is the first choice. The next requires an oscilloscope to ensure that the m detect line is actually working-this changes the display frequency to 70 hz which the mono monitor needs. The flashing is produced because the system is still producing the 60Hz for the color monitor.

From Basic, PUT, OUT, Print, and LPRINT send BYTES to the port. In order to send bits, you must first "unroll" the byte using ASL or LSR depending on whether
you want them high(D7) or low(D0). Many Basics don't allow inline assembly or have bits shifting commands. But theu should have a "USR" command for executing
assembly elsewhere in memory.

I thought that Lattice C and Pure C were fairly decent packages. I was
just recently returned an email from a developer of a very well know
TOS platform package, and he stated that it will not be futher developed
due to lack of a decent C package/compiler. This sounds pretty lame
to me. I had asked because I was going to order the package, but given
its cost, and no futher developement, I'll have to find another
application to fit my needs (its not the only game in town you know:).

Mike

The error appears in the info line of the CAB window. I've since found
out it's an error from the CAB.OVL saying it can't find the connection.
Odd that it would be selective that way, making some but not most others.
I gues it's time to email Dan...

From: drojo@marlin.utmb.edu
Message-ID: <6blepujuv1@allele.utmb.edu>
Source record: 108037

Hi Deano.

I am not sure if is the same program but v 2.07 of Specci can be found on:

zx_sp207.lzh 570.0K 1994 Feb 26
ftp.wustl.edu/systems/atari/umich.edu/Emulators/[8]zx_sp207.lzh
zx_sp207.lzh 570.0K 1994 Feb 26
mac.arch...umich.edu/Public/html/atari/Emulators/[12]zx_sp207.lzh
zx_sp207.lzh 570.0K 1994 Feb 26 mac.arch...umich.edu/atari/Emulators/zx_sp207.lzh

I got this with a Filez search, and surely it can be found in the zx
spectrum sites too.
Great program indeed, only lacks 128K emulation. It runs 98% of
the snaps I have tried, and in my falcon the speed is quite similar to the
real thing.

Hope this helps.

Daniel.

You can use Zmodem to download. Kermit does nicely, but the problem is
that it's quite slow. If you're in a shell account, try using sz followed
by the filenames, or sz * for everything in that directory.

JV>just a little thing is missing but what ? If someone had an already
JV>done NVDIVGA.INF file I wish they send it to me to avoid to make some
JV>errors while handling the resolution editor

I have a Crazy Dots I + Adapter here with a Sony 15sf II Multiscan and use the
following resolutions with 32k:
640x480 77 Hz
792x592 71 Hz
800x608 68 Hz

The problem with 32k and Cryzy Dots I is, that you have to use the highest
possible pixel clock to get high resolution and a vertical frequency of more
than 70 Hz.
If you have a similar Monitor, you can try these settings for good resolutions.
The Parameters in the order of VMG4000:
HRes: 800 VRes: 608
Blank: 288 Blank: 11
Imp-Start: 1664 Imp-Start: 603
Imp-Len.: 96 Imp-Len.: 4
Pixelclock=80 Mhz, HSync=42 kHz, VSync= 68 Hz

HRes: 784 VRes: 592
Blank: 216 Blank: 28
Imp-Start: 1448 Imp-Start: 592
Imp-Len.: 128 Imp-Len.: 8
Pixelclock=80 Mhz, HSync=44 kHz, VSync= 71 Hz

Hope that helps,
Johann

I saw the author of 1ST guides post in this thread and I didn't see a url to
his homepage? What is the shareware fee?

So far my luck has been pretty bad. I have downloaded lots of Avis and Mpegs
and I haven't had one load successfully yet. You don't know what file format
it is until it arrives.

Anyways, if anyone wants to know just how many Atari users are out there, there
are enough to fill my mailbox when I put up a post with Pamela Anderson video
clips.

I actually tried to UUE these in the mail, but it takes over a half an hour
and I stop the process when they got over 1.5 meg in size. I only have a little
hard drive:-).

THere are about 12 files between 350k and 900K in size.

The english documentation for HSMODEM07 from the Transaction team is
now uploaded to:

ftp.funet.fi
ftp.cs.tu-berlin.de
ftp.lip6.fr

and should be available for download in a couple of days.
On the Berlin server the docs are immediately available from the
dir. /pub/atari/incoming

2794. [WEB] A new Crazy Dots dedicated web page.

Newsgroup: comp.sys.atari.st
Date: 1998-02-09 00:00:00 UTC
From: dipching@ping.be
Message-ID: <6bn9t0$5ug$1@news3.Belgium.EU.net>
Source record: 107890

Hello everyone,

I have just terminated to build the first step of a new Crazy Dots
dedicated web page ... let's have a look from my main atari page at:
http://ping4.ping.be/dipching-drulkhor/ATARI-E.HTM

The page is talking about the hardware specification of the card and
also the way to update the model -I- to 15/16 bits ... also how to mount
the module, which jumpers to remove and proposing also some dedicated
tools like the Andreas Winter VMG4000, a 32K monitor drivers library
and also a file converter MKVGAINF.PRG which is needed when you are
using and old configuration file ...

I hope to add more things on this page soon.

Crazy Dots owners, let me know you exist !

Let's visit it and freely comment about it.

Yours

Jo

P.S: be aware that the pictures on this page are true color, so you
won't be able to take the most of them in 256 colors.

Only one question:
Does it exist a version of Calamus SL which supports more than 256
colors on screen ? (Excepted the Windows version of Calamus ... a
shame ...)

The "S" in shtml means "secure" and refers to a
method that makes secure financial transactions
possible.

Spelled completely, shtml means
Secure Hyper-Text Markup Language

There's a new extension that's appearing more and
more ... *.ASP ... and I have no idea what it is.

>What's a TOS image?

A TOS Image is a copy of the TOS roms (operating system) in file form. The are needed to run some programs such as PaCifiST on the IBM or a clone. If you own a Atari you can make your own TOS image by using a program called TOS Dump.

I make no claims about my knowledge on such things but I use, and have writen some ASP files. I think it stands for Active Server Pages.
They are, in this instance, script files containing HTML and Visual Basic Script (VBScript) that works with Microsoft's IIS (Intranet Information Server). Information can be read from various data sources. The web pages you see are created when you access them. The data sources are accessed and the server creates the HTML output.

I have written pages that read from and write to MS Access databases on our company intranet.

Rich.

Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other,misc.forsale.computers.mac-specific.misc

SyQuest 88 megabyte removable hard disk system with 6 (or 7) cartridges.
Drive is in perfect condition and all carts have NO bad sectors and are
in perfect condition too. Rarely used - only used for monthly backups.
This drive can also read 44 MB cartridges. This drive is SCSI.

Comes with 14 day guarentee to be free from defects.

Bare drive with 6 carts for only $349.

Bare drive with 1 cart for only $139.

Carts separately only $49/each.

Possibly available is an external case made just for this drive.
Most likely $20 _with_ purchase of the above drive.

2811. Score one for me!

From: james.burr@acpu.com
Message-ID: <887052071@acpu.com>
Source record: 107907

Okay. I've had it with constantly having to defend my Atari computer against those who use Windows based computers. Every time I go to a computer store (I'd mention CompUSA in particular but I won't) and they have to ask me what kind of computer I have. So I tell them and before I ask a question about a product I need they're on the floor laughing at me. They like to tell me that I need a 'real' computer and try to sell me some fancy super-giga-mega watt MMX machine with the latest OS (Windows something rather with umpteen million lines of code).
I ask this baffoon salesman just what's wrong with my Atari Falcon? He goes on to tell me how old they are and what not. I ask what he knows about Atari Falcons. I want to know his experience. He admits that he doesn't know anything about them and that he's never even seen one. By then I'm really offended and pissed off. I retort sort of loudly that that's exactly why I come to Comp...oooops almost said it...I come to your store only as a desparate last resort because they have salespeople who like to criticize, comment or condemn that which they know absolutely nothing about! Not only is that completely incompetent it's stupid and offensive! You mention I need to get a 'real' computer? Well, I'll tell you what a 'real' computer is! A 'real' computer is one that has a core operating system onboard in ROM! I can get a hundred viruses! I can crash ALL my hard drives! No matter what happens to any of my disk systems TOS is always there and my machine is always operational from that aspect! What Windows machine can you do that with? Not to mention the simplicity of TOS and GEM applications. It took me five minutes during my first experience with a TOS computer to nail the basic operations and for Windows and IBMs and such I have to take a college course or read a 1000 page book to understand an OS with 14 million lines of code! Speaking of code Windows has so much fat in it that it'll give anybody a freaking heart attack. My dad has a Pentium with Windows 95 he's been using for three years and to this day he doesn't know how to copy a file from his hard drive to his floppy drive. And talk about that horrible God-awful file manager, what the hell is that? You've probably never seen a file selector before...

I went on for twenty minutes cussing them out. Those who like to comment on that which they know nothing about really piss me off. It's bad business.

I thought it was about time I went on the offensive for my computer instead of always defending it. I made those salesmen feel so stupid yesterday. They were noticeably embarrassed and rightly so.

Later,
James

Aloha,
I might as well add a little to this thread...

I actually played around with the Hotz stuff at a NAMM show in Chicago.
I would guess that was back about 1991-1992.

It did essentially remap a keyboard so that you could not play "wrong"
notes (according to the music you were playing around).
It reminds me of the harmonizers they have now, that understand the
scales and proper notes and shift a voice to be "in tune".

The input device was like a big drum pad which was touch sensitive.
I played it for 5-10 minutes... and came away less than enthusiastic.
Playing it felt alot like a straightjacket, but for a non-musician
it would probably be a gas.

Personally, I'm still waiting for a harmonizer that has a John Lennon
setting,
so that not only do I not have to learn oh to sing, I'll sound just like
him.
Then some software that writes lyrics as good as Dylan and I'll be set!
;)

I should say here that MiNT is definitely NOT a problem here. Just load
STinG after MiNT, to work around that stupid MiNT bug that's been in it
for almost a decade now.

> Peter has made it VERY clear that he
> has no interest in using MultiTOS, so it's not fair to ask him. All my

I've tried to use MultiTOS several times. Apart from being slow, I've seen
inexplicable crashes all over the place. This was even though I've spent a
fair bit of time to set it up correctly (Hell, just a few files, what's so
difficult to set it up you might ask. I agree, it shouldn't be that hard,
so the explanation can only be inside MultiTOS) So all the goodies the pro-
grammer gains from MiNT are voided by MultiTOS due to the exceeding diffi-
culty to do debugging in a reasonable way. It's a pain if for every second
crash you discover that it originated from the OS, and not your software.

This is why I do not support MultiTOS. I do support Geneva and NAES as two
advanced AESs for MiNT. If you have any problems with STinG under those,
for which you can conclude that they are caused by STinG, I'll go and try
to fix them.

BTW.: Apparently there is nothing in STinG that causes problems with MultiTOS,
as I know a few people who got them working together to their satisfaction.

Cheers Peter

Actually it's not that bad, a timer value of 100 ms were ok. Checking for
data that came in is done in virtually no time, so the evnt_multi overhead
is left. This can be bad though, depending on the implementation, and the
OS. An efficient AES (MagiC; NAES ?) should ease this a little too, so that
CPU waste may be around 5 % or less.

But certainly you're right in saying that it's ugly in many respects. But
there is no choice without hooks in the AES' evnt_multi for external events.
And even if they were there, CAB won't use them, unless changed accordingly
by Alex.

At least with MagiC, the OVL could use Threads, similar to how you've done
it for the MiNTnet OVL (Sure the non-threading code for single-TOS had to
stay in place). However, I believe Dan will never do it.

>>I am quite impressed by the description of the MINT/CAB OVL that I

>>Peter and Dan.
>
> I see your position; I guess you're trading off one source of pain for
> another. In the MiNT case, installation seems difficult,

I think you're simplifying things too much here. There is a lot more reasons
to choosing one or the other. The main point for me always was efficiency,
since I've got neither Falcons nor TTs, MiNT always was out of question as
MagiC is a lot more efficient. On the other hand, if you're used to Unix,
and have the CPU power to not notice the reduced efficiency too much, then

you'll certainly be very satisfied with MiNT. But it depends on many things,
even on whether your favourite software runs with it.

When talking about MiNT, I do not mean MultiTOS. I'll keep crusading that
bug-ridden thing ;-)

> but the programmer's
> job is simplified and as such, applications can be made more usable, more
> easily. In the other case, installation is simplified, but the programmer's job
> is much harder,

I used to take that as a challenge. Programmers, like other people in other
areas, get lazy if things are made too easy ;-)

Are you possibly using an older version of STinG ? The PPP code in the
V1.06 had a bad bug that caused precisely these symptoms. Update to the
last version, best from my web page.

Anytime I use CAB's 'URL to clipboard' or qed's disk-based clipboard
under Geneva the following error occurs:

Process <Unknown>
exited with status #11860
(undefined error)

What is so different about these two applications that would cause such an
error? The text does make it to the clipboard (scrap.txt), though.

Just to follow up my earlier follow up !
You could record your sequence with Cubase, save it as a midi file and
then load it into Smptetrack for the sync to tape features.
This box is rugged and reliable.

Hi! You need to talk to Brad at Best Electronics.

The Address is:

Best Electronics
2021 The Alameda, suite 290
San Jose, California - 95126
(408)243-6950

Best Electronics bought out everything Atari had in their office builing
and the stock items in their warehouse. They have just about
everything Atari ever made including custom components and parts. Brad
has put together and published a catalog with 228 pages of nothing but
Atari hardware and software and even included pictures and documentation
of the prototype equipment that never made it to market as well as
memorabilia. He sells these catalogs for $7.50 U.S. which is what it
cost him to make. He has many of the things you list in this catalog.

Later,
James

-> Did that. Now the macchine just shows flashing horizontal bars on a white
-> (or white with light blue) screen. Any rememedy to this?

Okay. I've been here before. Three chips to check.

Locate the

MMU - CO25912
GLUE - CO25915
Video Shifter - CO25914

Make damn sure your grounded to prevent ESD damage.

The MMU and the GLUE are the two large square PLCC chips. Carefully
lift on the corners of those ICs (alternating corners after lifting them
out a little) one chip at a time. Turn them over and inspect the pins
carefully especially the corner pins to make sure none are touching each
other. Reinsert each IC making damn sure pin one is where it should be.
If you notice all the writing on the ICs go the same way.

This happened to me and I got very interesting results.

Then locate the Video Shifter (inside the large RF shielded box_and lift
carefully the IC out of its socket and push it back down.

Reassemble your machine and try it out.

Later,
James

IIRC the Supra host adapter does not support Parity. Are you able to
turn Parity OFF on the Zip?

They are? I looked at them today and I think they look quite nice. There
are a few glitches but they look much better than most pages I have seen
before. They are also under construction. so don't judge them to early.

> It's been the first time that I've seen somebody using white text on a
> white background (!) It's ridiculous.

Where did you find this? On your own pages? ;-)
Seriously I couldn't find this anywhere at all. Tell me where?
BTW. Background colours looks to be something that they havn't masterd
at all. Maybe it's a limitation in the webdesign program they use.

I realy think we should see this as a postive thing as it's not realy
often you see someone making a serious try on making something useable
for Atari users. Look at Wizztronics web pages. They are pathetic and
looks like a bunch of kids have knocked them togheter in 5 minutes.
And these guys are our future? Bha!

If I would bet a penny on any company it would be FALKE Verlag and Milan
GBH. Atleast they try to be professional and for that they should get
or respect.

Well, here I was rambling again... :-)

Why? If this is the law, window shading wouldn't work either. And what
about
Alice? How the hell can it iconify programs which even knows how to
spell to
iconify? I was talking about something taking over the system just like
shading does. Alice does it, Freedoom does it, but I guess that is just
an
illusion as it can't be done. If someone is talking nonsense it's you as
this
sorts of things is done all the time.

I know that move/size isn't very usefull but iconfy would be. It should
ofcourse
only be used in some cicumstances and not all the time, just like

shading of
windows.

Not completely true as it doesn't need to move just one pixel and I do
know
how this works. You don't need to correct me all the time treating
everyone
like a braindead zoombie.

And what do you mean that there is no realtime moving and sizing? It
works
just like you described realtime scrolling. no difference except the AES
call.

I know. I got a reply from the Adamas guy and he said that all the
functions
found in his library (see the header file) is needed. I guess it's basic
BSD calls.

> > that would work with Adamas
>
> This seems to suggest that you read my paragraph on APIs and libraries
> again ;-)

:-)

> I was not after writing a replacement for the Draconis API. Maybe it's

> Adamas source code is not available ?)

As I said the socket library is available and there is a headerfile with
all the calls needed by Adamas. They should be regular BSD calls and
should
therefor be documented. I would guess your BSD library will cover them
so
it shouldn't be a big problem.

If you want me to I can mail the library, including header file, to you.

Exactly. It enables preemptive multitasking and the time slices. This
could be
one problem, that preemptive multitasking is enabled while loading the
auto
folder, and some may not like it.

It works on a AB040 but not very fast. Smaller (160x120) plays always in
realtime if you have a Nova and 16-bit colour. It was some times since I
tried it so I might be wrong... I will try it if I get the time.

I am using QED 4.0 and the best way of using QED/CAB/OLGA is to press CTRL-S in
QED and then CAB automatically reloads the page.

But it's MagiC who creates the buffer so you wont be able to mark it as
none
cacheable as it's already created. MAGXBOOT loads MagiC into RAM and
creates
the buffer, or I have missunderstod it and MagiC doesn't creat anything.
Who
is reading who?

> > This will not work as MagiC creates the buffer somewhere and you don't

Hmm... This happened to me when I had MagiC 4.x, but I've never
experienced it under MagiC 5.

> 2. Extendos became unstable - not always to access CD-ROM drive

I don't use Extendos, but AFAIK you have to use the latest version
with MagiC. I use SPIN, which works very well with both MiNT and
MagiC. Probably the best driver around.

> 3. Boot problems - get message **System Destroyed** messages.

Do you use the ICD harddisk-driver? I had to drop ICD Pro and use AHDI
instead. I now use HD-Driver which is *the* harddisk-driver.

> 4. Desktop not as good as TOS - Can't assign function keys to Icons

Agree, the desktop is pretty basic. But it's fast and functional,
really nice if you're low on mem. Personally I prefer Thing.

> 5. Unexpected system lock ups

Happens to me sometimes as well, for no apparent reasons. Other times
it happens when an application crashes, unfortunelately MagiC doesn't
handle this very well and dies.

> Is there a better multitasking OS for the Falcon030 that is more stable
> than MagiC or might there be problems with my installation?

Personally I use N.AES now, it's fast and extremely stable.

> With MagiC removed - my Falcon030 is very stable.

Same here, on my Falcon all versions of MagiC are unstable. MiNT/N.AES
is extremely stable though, crashes are very rare.

Hello,

Does any one know of a Boot Selector that works with Magic and a Falcon.
I was using Stoop quite happily until I switched to Magic and now it
wont work because it expects a 640x480x16 screen resolution and Magic
boots into ST High.

Thanks for any info.

Michael

Well, I still use Stoop withe the same config;
the only drawback is you can't configure it from
the desk under MagX, though it's still feasible as
before, at boot time or within a text editor!
Only thing is u'll have to set ur boot rez at 640 480 16

Good luck!

Whatever was causing my problem is rectified. I was running an older
version of OLGA (1.30 is installed now). I'm not sure if it was the older
OLGA or troubles with the transition from default.qed to qed.cfg. In any
case, things are back to normal.

There is no problem at all with using Stoop and Magic.

Magic only boots up into high res because that is how your magx.inf file
tells it to boot up.

Locate the line #_DEV (something like that anyway) in the magx.inf file.

Change this line to #_DEV 5 27 and this should boot magic up in 640x480x16.

Actually the software was available commercially and it quite useful if
you're a composer. I don't have the controller, but it can be used to
remap a standard MIDI controller.

As far as it being used with "Hotz Code" as a home entertainment device,
I have to agree that that was not the greatest idea.

Stoop ran once Magic rebooted the system? This shouldn't (or least doesn't
in
my case) happen.
Stoop loads, I select my MagiC configuration, Magic loads, resets the
machine and continue processing the auto folder from after the MagiC
program.

Which version of Stoop are you using?

--- reply ----

Not that 5-10 minutes makes me an expert, but I'll give another 2cents.
you can only play "in key", no grace notes.
basically it tries to make you sound good by restricting the notes
played.

but heck, if you've found one... check it out, ... play it.
If it's over the web, you'd better use a third part company like
TradeSafe...
If this thing is broke you'll probably never find anyone to fix it.
My understanding is that the software runs on an Atari.
If that's ok with you .... then this esoteric alternate controller is
probably for you.

Sounds like tin... And I have never seen a news-reader with tin's
excellent threading. Tin is also fully mime-compliant, has very nice
filters and is easy to use. And best of all; no windows ;-) Oh, and
it's completely free and available on most platforms. And the editor
know how to wrap lines, it also reformats quoted text... It's the
'pine' of newsreaders :-)

2870. WTB (UK): Dead STE and Falcon PSU parts

Newsgroup: comp.sys.atari.st
Date: 1998-02-10 00:00:00 UTC
From: chrisc@zetnet.co.uk
Message-ID: <6bql9j$p0k$1@irk.zetnet.co.uk>
Source record: 107795

Hi Folks,
I want to buy a dead 1040 STE (or STF/M if they are the same) PSU and a dead Falcon PSU. I'm really only interested in the bracketry, the insulator under the PCB and the lead that goes from the PSU to the motherboard. However I might as well buy the whole lot to save you cutting the things up incase there's something I don't explain to well. I need these parts as I'm putting my Falcon and my STe into a common (and rather huge) case, along with a bunch of hard-drives and assorted accessories. I want to run the ST and Falc off their own supplies, with a PC PSU running the HD's and some vanity flashing lights (anyone for the Fuji logo in tri-colour LED's cycling round their colours.....

Anything considered within rreason, what do you want for them, I have some games software (along with Neodesk 3 come to think of it) if you want to swap....

(*raises his hand*)

If I can add my two cents to the resolve debate, I believe that the greatest problem is for thos ecurrently using no multitasking at all. I cannot tell you how many times I've had to reboot my computer becuase some site did not respond to the resolve, and since the computer is locked, I have no redress but ctrl-alt-delete. In fact, it happened only moments ago, which is why I write this letter from my roomates PC running Turbo Linux. It's sad that Linux ismore stable than my Falcon, but it's very true.

Just wanted to add my two cents worth,
George Garner

Something about pizza? Chucky Cheeze?

Tried to buy Atari back from the Tramiels and failed. Try to find the Wired article of a year and a half ago, that traced the careers of most of the key Atari people. Also you could check out Don Thomas' page on Computer History, http://www.14software.com/icwhen/

A friend of mine recently downloaded an Atari 2600 emulator for his PC. Talk about a blast from the past! I was in heaven going through all of the old titles I grew up on. But itlead me to think, there's emulator programs for Window$ 9.x, OS/2, Linux & Unix, even Mac, but nobody has done an Atari one? At least, none that are listed on the site. Hey, if anybody out there has or knows where to get one, please drop me an email! I'll be happy to download it (insert eager child here) and happier to make mention of it in emulator newsgroups.

Just a thought,
George

Hi, I still have some software from our Atari 1040ST which we sold years ago. I remember Marble Madness and Donald Duck's Playground off the top of my head, but there's probably a half dozen store-boughten games there at least, all with boxes and manuals. I have no use for this stuff, and would take any reasonable offer, I think I still have some disks with some Atari shareware programs on them too, if I can find them, I'll throw them in as well. I might also be interested in a trade for some IBM compatable stuff, but I really just want to find a home for this software either way. Send me mail if interested.

Hi Harry,

I am puzzled by your puzzlement. Surely, if your mail reader is smart enough to wrap lines to fit your reading area, it is also capable of ignoring a few stray cr/lf embedded in there for the benefit of us dinosaurs.

Also, I'm sure your text editor is capable of wrapping lines and inserting end-of-line characters where needed. Some other people's editors apparently don't. Old, outmoded software, no doubt. ;-)

Ascii e-mail/usenet has been around for a long time, and AFAIK proper text formatting was always the responsibility of the sender. There is still a large body of current software that works that way. So, unless you're Microsoft or Netscape, why would you want to change established usage just to break other people's software?

> Nevertheless, it is true to say that ASH are failing to

Precisely. Standards do change, but there's no need to be obnoxious about it.

Where is FiST available? For the most part I'm very happy with Net2Net, and the author has done a lot of work for me personally, but I still wouldn't mind taking a look at FiST.

Absolutely. It works great as a BBS front end. You really ought to look
into Octopus BBS, though. It's so good, it probably added a year or two to
the life of my BBS, because I'd have no doubt taken it down many, many months
ago, if Octopus hadn't come along.

That's weird. Stoop doesn't even run on my MagiC Falcon unless it's following a cold start (i.e. MagiC is not present). So I don't have that problem of Stoop running again after MagiC does its soft start.

I guess they'll have to learn the hard way. I think it's commercial suicide to come out with a browser that requires a STiK-incompatible stack. The market is too small to support two stacks, and STiK already has the market pretty much sewed up. CAB can get away with their proprietary stack, because you can also use CAB with STiK-compatible stacks.

BVT> exist? Gemview -
BVT> Same..... ST GUIDE
BVT> - What is the latest version of this program and where do I find
BVT> it?
>>

Hi Brian,

AFAIK Photochrome was suspended a long time ago, SOL ditto, Stuart Denman left the Atari scene after releasing v. 3.8 and started working on the IBM platform (at least, that's what he told me a few years ago).
Gemview is/was at v. 3.17 AFAIK, but the save JPG option is only available when running in Truecolor, when I'm doing 256-colors it ain't there...
And as far as I got the msg, Mr. Vollbeding is residing on another planet.

There's some commercial packages which save in JPG, and there's Graftool (shareware which "costs" you only a message to the author saying you're using it and you'll get a key, but it doesn't save in JPG. It supports TIF, PNG though).

Looks like you're not using a GFX card, then I suggest you should give Graftool a try... on 16 color screens output is close to SOL/Photochrome!

For AVI/MOV (Apple QuickTime) I prefer Aniplay. I forgot how it worked in TT medium, but in 256 colors or Truecolor it's perfect. I recall v. 1.20 has been released recently.

Ghostscript does indeed allow you to read or print PDF (as well as
PostScript, well most of them anyway) files. A web search will get you a
handfull of sites from where it may be downloaded, however some of them don't
have the later version 3.53B.

Configuring it is somewhat tricky, it has been covered a few times in this NG.

m> at 9600 baud? curious since my unix and same modem...I run at
m> 28.8?

Activate the serial.cpx that came with STinG and check the serial port settings. If you have an ST it should be set to 19200, 8N1 and RTS/CTS.

You should also have the HSModem patch in your Auto folder in the order:

DRVIN.PRG
MFP.PRG
STING.PRG

m> Anyway...where do I go from here...? After exiting the Dialer..
m> then what do I do?

Whatever you want, FTP, newsgroup or mailing with Newsie, Web browsing with CAB.

Ah right, thanks. I saw this or a similar item on sale in an Atari store (I forget where now, it's long since closed), but it was so expensive that I built my own. It's not difficult, I built a short cable with Dway connectors so that I could disconnect the 5V feeds from the printer and feed the controller directly from a regulated 5V supply. I even had remote LEDs for repeating the info on the SLMC804 controller so I could leave that dangling behind my desk. The project was published in an early edition of ST Applications.

Since a short time I am working with Sting (PPP). I like it. It looks
if is a lot faster. But I also went from a 14K4 to a 36K6 modem, so I
can not say for sure. But when I get a connection, it is at 115200.
How is this possible? My modem is 33K6 and my port is 76K8. Als
sometimes I do not get an IP-adress from my provider. I always use the
same provider. Is this a problem at the side of my provider, or
something on my side?
When I get Email from my girlfriend the quotes are replaced by a 'ae'
character. What can I do about this? I think she uses Netscape. She
does it through an internet-cafe.
I heard that it is a good idea to work with proxy-servers. How is this
done?

David Knight <D.A.Knight@ncl.ac.uk> writes:
> Change this line to #_DEV 5 27 and this should boot magic up in 640x480x16.

This won't help at all. The #_DEV line only tells MagiC which resolution
it should use once the auto folder has been finished. MagiC /always/ boots
in ST-High, no matter what you put in #_DEV.

A possible solution to the original problem would be to use a little
program (three lines C-source) that switches to 640x480x16 and place it
physically in front of stoop.prg. Note, though, that I'm not sure whether
Stoop is MagiC friendly at all, as I don't use it.

Ciao

#_TSL does /not/ affect the auto folder, as running auto folder programs
in parallel may cause disasterous effects. It only affects the programs in
start-folder, i.e. those programs run directly after the files
in the auto-folder have been executed.

Ciao

I think I must have missunderstood the original question.

No need for another program.
Stoop should be placed *before* Magic itself in the Auto folder, this way
you can select if you want Magic loading or not.

Stoop should be first in the folder, followed by Magic itself.

Thanks for the info, Terry. I'm wanting to add the RSVE port upgrade to my
Mega ST and use Semper as the front end for my BBS. Express is quircky with
higher port speeds, and you can have Semper answer at a high baud, then hand
off to another program, right? ;-)

BTW, I got my 17" monitor-it is awesome and a half!!! <silly grin>

-><< Neil >>

Neil, you didn't recently upgrade Geneva, did you? I did and the latest version has some problems with the way QED uses the cliboard, for example. I can't cut 'n paste anything without a big error message. Hopefully, Dan Wilga will fix this soon! ;_)

I don't entirely understand newsfeeds, but maybe this will help...

Below is the path your post took to get to my particular news server.
Each one appears to be a different 'stopover', number 1 being your
NNTP-Posting-Host. Other people will have different paths, of course,
but the initial ones will show the post's origins. In this case
'newsfeed.internetmci.com', probably a very good news server, handled
the post's propagation after 'news.eli.net' passed it on there:

8) nntp.portal.ca
7) news.bc.net
6) arclight.uoregon.edu
5) newsfeed.internetmci.com
4) 207.0.56.122 (news.eli.net)
3) news.eli.net
2) blushng.jps.net
1) 209.63.113.23 (sea-port16.jps.net)

In NEWSie, I log onto 'news.dsoe.com' and then NNRP kicks in and logs me
into 'nntp.portal.ca'. NNRP stands for Network News Reader Protocol. I
still have access to my ISP's _own_ news server (news.cyberstore.ca),
which like yours is so terrible for newsfeeds. Sometimes it has 'new'
messages that are one month old; many are a week or two old. I used it
for months and months (following threads was difficult). Like I say, it's
my ISP's own news server -- 'news.dsoe.com' was added later, but that's
just a 'hook' via NNRP to a reliable news server on another ISP. Complain
to your ISP and ask them to set up one of these relays. Some of my posts
to 'news.cyberstore.ca' weren't circulating at all (except to that
server). I sent copies of the posts to my ISP, including full headers to
show that they were, indeed, being posted correctly (i.e. they did end up

on their server as proved by the assigned Message-IDs). It was shortly after this that they implemented NNRP. From what I know, NNRP requires an agreement with another ISP. By that I mean the secondary ISP will allow news server access only if the originating IP address is within range of legitimate account holders (other ISPs).

The paths listed above aren't going to help you, but you could do some test posts with your other ISP. Maybe a bad 'stopover' could be discovered?

But you said this was your third attempt -- what happened with the other two? Any clues in NEWSie's log? Did they actually get 'posted OK' or are they just not circulating?

2914. Cab v2.5/Gemjing Question

Newsgroup: comp.sys.atari.st
Date: 1998-02-10 00:00:00 UTC
From: hoffart@ruf.uni-freiburg.de
Message-ID: <19980210001320904087@isdn3-135.home.uni-freiburg.de>
Source record: 107855

Sorry, Iï¿½ve got to post some old answers of me, since they never
appeared in this newsgroup due to a gateway thatï¿½s not working properly.

RJH>Now, when I test the Gemjing module by loading up the test page, it
RJH>will "moo" but I can not get it to quit. I tried control L-shift,
RJH>like the docs say but that doesn't work.

What version of GEMJing do you use? The latest version is 1.06. Download
it from my homepage.

RJH>It makes me do a full power off reset.

Oh, you have no pre-emptive Multitasking? Otherwise you could change the
link and CAB will stop GEMJing playing.

RC>I have is that the sound is about an octave lower than it should be.
RC>Can't think what that might be.

Perhaps the sample is recorded at 11kHz. DMA playback on STE/TT allows
only 6.25/12.5/25/50kHz so you can hear the difference between 11kHz and
12.5kHz.

2916. Texel

Newsgroup: comp.sys.atari.st
Date: 1998-02-10 00:00:00 UTC
From: hoffart@ruf.uni-freiburg.de
Message-ID: <19980210001321904194@isdn3-135.home.uni-freiburg.de>
Source record: 107857

CW>- which version of Excel does it compare to?

None. I don't think that it is a good idea to compare Excel and Texel.
They're very different.

CW>- can it load and save Excel-format files/worksheets?

Texel 2.0 can load most of Excel 2/3/4 sheets. Macros are not converted.
If you are interested which tags are converted just send me an email.

CW>- does it support 'workbooks' and external file links?

What's a workbook? You mean several sheets in one file? No, not at the
moment. External file links? Texel supports OLGA, which is object
linking. You can add HTML tables to Texel sheets, GEM/CVG/CWG
metafiles/vector graphics, PI3/TIF/GIF/JPG/PNG and other pixel graphics
and so on - if you have applications that support OLGA ID4 (object
linking for GEM applications with inplace drawing), for example STELLA
2.6, ArtWorx 1.6 and others.

CW>- what are its printing capabilities (I have NVDI 3.02 on my Falcon
CW>under Geneva)? ie. can it size to fit, print portrait or landscape,
CW>etc.

It can. A GDOS is required for printing, NVDI >= 3.02 recommended.

CW>- are there keyboard shortcuts which are the same as Excel's?

Only a few because Texel is a GEM application and not a Windows
application.

CW>- is it available in English?

Yes, but I don't know if it's V.1.60 or 2.0. ASH sells version 2.0 in
Germany.

CW>but (unfortunately) my German is very very limited...

Have a look at http://members.aol.com/hoffart/zsoftware.html which is
half German and half English. Sorry but is a lot of stuff to be
translated and my English is not very good so not all links and sublinks
are English.

GE>You need to buy ArtWorx (in German only) to get graphs -- Texel will
GE>pass your parameters over to that program to do it. This was never
GE>mentioned in ads, or even in the docs.

Bad thing. In German ads this was *always* mentioned. In addition to
chart graphics you get with ArtWorx a fully functionable vector graphics
drawing program with EPS/AI/CVG/GEM export and so on.

GE>There are other problems with the program such as slow data entry
GE>under Geneva.

Which Geneva? I tested Texel 1.6 and 2.0 under Geneva 4 (German release)
with cooperative multitasking and it worked.

GE>All in all, a very slick looking package that doesn't really hold its
GE>own against LDW Power 2

Which version did you buy? Texel 2.0 has Excel import and macros with
GEMScript/Scripter. Texel supports arguments lists which can be as long
as 255 chars. And it is a modern GEM application running on nearly
everything with at least 1.5 MB free RAM, TOS >= 1.04 strongly
recommended.

And it has OLGA support, even OLGA ID4: you can embed objects (files)
into your sheet, for example JPG, TIF, GIF, HTML, GEM and so on, with
ArtWorx, STELLA or something equivalent which support OLGA ID4.

MK>Ofcourse is it nice when programs cooperate, but when you buy a
MK>spread sheat program you still expect it to output charts, even if
MK>it's in a limited way.

/You/ still expect that, right? :) I have several spread sheet programs
here and only a few of them can draw charts itself.

And I don't see the point.

a) Thomas (programmer of Texel) would have programmed the whole graphics
and chart routines himself. He would have spended a lot of time (=
higher upgrade price) and there would be no editing of the graphics.

b) Thomas and Christian (programmer of ArtWorx) developed an interface
between two existing and reliable programs - it works. You can get them
as a bundle at a reduced price. And you can edit the graphics, export
them to EPS, AI, CVG and so on ...

Where's the problem?

EH>Certainly they should carefully advertise this need wehn they
discribe
EH>their product. Many programs require some form of GDOS in order to
be
EH>able to print, or maybe in order to print charts, but they usually
EH>carefully mention this in the product description.

I don't know what System Solution does but in Germany it *is* described!
You can read "graphics in combination with ArtWorx" in the ASH mailing.
Texel was never advertised to do graphics on its own - it is a bundle
...

When Microsoft sells Excel and Excel loads DLLs for drawing graphics and
charts, it seems okay. But you must buy both.

When ASH sells Texel and Texel can load ArtWorx for drawing graphics and
charts, that's not okay? I don't understand this. If you don't need
graphics, you don't have to buy both programs.

EH>does Texel now finally really import and export Excel documents?

Texel 2.0 can import most of Excel 2/3/4 sheets and export them (for
example) as a SYLK file (a Microsoft format). Export of Excel documents
is not finished.

Ever tried Pure C? It has got a good helpsystem and a source level
debugger. There is no inline assembley possible, but assembley
code can be easily included in a project.

It's perfectly exact, I own 1.6 Texel german version and I use it with
geneva 005 and Neodesk 4.xx(latest one) and it works perfectly !
Also i have been able to test the 2.0 Texel demo version under the
same set-up and also yes it works perfectly.

Thanks for the advice so far. Placing Stoop before Magxboot is exactly what I first did. This results in Stoop running; you select your Magic configuration; Magic reboots into ST High; Stoop loads again and complains about having the wrong rez. Perhaps this would be OK if Stoop exited gracefully - I'll try it again tonight and see if I can live with it. I guess I was hoping that someone had found a more elegant solution.

2931. Is CAB a secure Web Browser?

Newsgroup: comp.sys.atari.st
Date: 1998-02-10 00:00:00 UTC
From: Gilles Charron <rbbcoop2@nortel.ca>
Message-ID: <34E08F13.8A985946@nortel.ca>
Source record: 107872

Hi,

Just wondering if cab supports data encryption like Netscape
and E.I. If not, is it planned for future releases?

Such a thing will be needed if we want our fellow Atarians to do
some Internet Banking and have access to all those neat services
that the 90's have offer...

Could you be so kind to tell in a little more detail what you did to fix it?
e.g. what srews are you talking about, on the SM125?

I had similar problems with a SM125 hooked up to my MegaST. I solved it
by grabbing the SM124 of me kids -they got the SM125 in return, he I'm not
a bully- but I sometimes think I prefer the SM125, so please enlighten me..

XaAES isn't working too well, try oAESis instead. It's much more
stable and quite usable. Too bad it hasn't been updated for long
time (has the development stopped?), because it had lots of potential.
Anyway, it works with most GEM software adequately and I used it on
Falcon quite a bit. And it's very fast compared to MultiTOS with
AES 4.0 or AES 4.1.

BTW. speaking of MultiTOS, could someone mail or post me GEM.CNF
file? I lost it and I don't remember all the options in it.

: them to EPS, AI, CVG and so on ...
:
: Where's the problem?

The problem is, you can not get them as a bundle anywhere but Germany.
The Power User deal only works if you buy direct from ASH. Also, the
price of both programs together is a bit dear.

Earlier you commented that we do not complain that MS Excel requires
DLLs to print charts, the reason we do not complain is they come with
Excel, are installed effortlessly and transparently, and, whatever the
charge for the DLLs, it was included in the price of the spreadsheet
program, and low enough nobody complains about "I don't need charting,
why do I have to pay for this."

Of course, it all boils down to economies of scale, etc. It looks to
me like there is no easy solution to the complaints that have been
psoted in this thread, and that the authors of Texel have done their
best to compromise between creating features,/program robustness and
having some fair modicum of compensation for their efforts.

JA> If you have a similar Monitor, you can try these settings for good
JA> resolutions. The Parameters in the order of VMG4000:
JA>
JA> HRes: 800 VRes: 608
JA> Blank: 288 Blank: 11
JA> Imp-Start: 1664 Imp-Start: 603
JA> Imp-Len.: 96 Imp-Len.: 4
JA> Pixelclock=80 Mhz, HSync=42 kHz, VSync= 68 Hz

One thing worth remembering is that the 1Mb Video RAM supplied in the card is
not 1,000,000 bytes, but:

1,024Kb = 1,024 * 1,024 bytes = 1,048,576 bytes

What that means is that you can extend the resolution beyond 800*608*32k to
832*624*32k (keeping the 4:3 aspect ratio and remaining byte-aligned).

32k colours = 15-bit , which is contained within 2 bytes, so:

800*608*2 bytes = 972,800 bytes

832*624*2 bytes = 1,038,336 bytes (which is less than "1Mb")

It works here (on a Crazy Dots 2 with the same 1Mb RAM on board)!

y> you still paid money for a broken product.

I'm coming to this discussion late - partly because I don't understand it.

I know that text lines ought to be less than 80 characters long, but this is surely only because the reader software isn't capable of wrapping lines properly. Really speaking this is the problem of the reader being stuck in the stone-age.

Is there no option for the people here who use old software to upgrade or to ask the author to support line-wrap properly? If not, I apologise but I wasn't aware this was the case.

The software I'm lucky to use is LED (I get this group piped through a local BBS) which allows me to specify different line widths for reading and writing (I'm set to 74 columns for writing and 85 columns for reading). That said, I think it's the process of exporting the message that actually firms up the carriage returns at the appropriate point...

My only wish is to go up to 100 columns for reading, but 85 is the maximum and line-wrap is perfect anyway.

Nevertheless, it is true to say that ASH are failing to support the existing standards and should not really invent their own...

I used a Supra host adapter for a number of years. I think it was the
same card which they put inside their 'shoe-boxes'. At one time I had
4 devices on the bus which all worked OK.

The only trouble with the Supra card which I had was that it did not
support parity which meant that a few (very few) devices which did not
allow parity to be disabled would not work with it.

Don't confuse the DTE speed (computer to modem) and the DCE speed
(modem to modem). Most comms programs will call the DTE speed the
'Connect' speed and the DCE the 'Carrier' speed.

Of course you will not get >33K6 DCE - it may be less if your
telephone lines or your ISPs modems are not good enough.

The 115k2 is your DTE speed an is appropriate for a DCE of 36k6 (or do
you mean 33k6?). If any compression is likely to take place then DTE
should be about 3 times DCE. Hmm ... you say your port is 76k8. I
wonder why you think this as it obviously is 115k2.

It depends on what OVL you use. So far only the OVL for MiNTnet
supports encryption (SSL), I have heard that the author of the
STiK/STinG ovl works on SSL but I don't know how much he has done.

I had this problem myself. First of all go to the STinG page and get
the updates. There are updates through Jan.29'98. Second, check to
see what order you have sting in your autofolder. It is a must that
you put STinG.prg last in you autofolder. Once I did that,
Initialising link went through and got IP and Initialising was an
sucess. If you are using hsmodem7 put that before STinG in your
autofolder. This should clear things up.

>> functionable Atari platform. She will play Pippi Longstocking on it.
>
>Then maybe you should move it back. Windows e-mail clients at least conform >to
>Internet mail standards. Until the Emailer does that too, you have no fully
>functional Atari platform. What about IRC on your "fully functional" >platform

As I once said, my long lines here aren't long in MS Outlook Express/97, older MS Mail or in Emailer, I can re-size the GEM-window and the text follows in real-time.

IRC yes, hmmm... nothing wrong with FracIRC or aIRC but the IRC initself, o.k folx uses mIRC etc and IRC is still huge on the net, but I prefer the
new webbased IRC-concept at communities with more interactive features.
IChat etc.

I had (not anymore, changed provider now) a UNIX-account with IRC, lynx,
Pine, ncftp etc
But the kids and students today at schools and the common PC Internet user
doesn't use these protocols in general. The WWW and MS Windows is "burned" in their heads the first time they see a computer.

The sad (good?) thing is, that it seems that ASH is on this direction. Who knows, one day they maybe integrate parts of CAB in MagiC and PPP-Connect as a natural API in the operating system.

This is what I meant with a "fully fuctional platform" and I haven't said a word about the jinnee desktop that I proudly use or the GEM-Script concept.

All these apps made me to "give" away my PC.
..and my daughter, today she said that Pippi Longstocking is not good enough, she want's to play Tomb Raider II instead, and she's not four years old yet.

You know, when I bought Tomb Raider II and Jedi knight 2 my brain was nearly re-programmed for the PC-concept. For the price of these two silly games you can buy a "fully functional software platform" from ASH.

>BTW ?
>
>I do not understand that. On your web page you're advocating STinG, but >here
>you're praising ASH ?

no, I promote Atari and will not choose nothing.

..and as we all know, StinG is really a masterpiece. Just the thing that its capable to connect Atari machines in a standard TCP/IP Ethernet network is stunning.

1. I bought an Atari Super Pong at a rummage sale.
2. Someone expressed interest in it, and I was getting ready to send it to them.
3. Had a HD crash, and then other problems caused by an extended ice storm. And I lost all trace of the name and email address of the person I was corresponding with.

I would like to:
A. Get back in touch, so that it goes to you, since you were the first to request it (I'll remember your name when I see it). I'll give this option 10 days, from 9 February.
B. Provide it to the other gentleman that requested it, but was advised that I had promised it to someone else (I'll remember your name when I see it too). 20 Days, from 9 February ("A" takes precedence).
C. Provide it to anyone else. ("A" & "B" take precedence, naturally).

It will be sent to you as-is. Untested, and needs cleaning. All I request is that you pay the postage, approximately 3 pounds, from Bangor, Maine, USA.

Terry

Maybe I've been out of it for too long, but I was using Laser C which to me was quite efficient and by far the clearest IDE of any of the C compilers back then, though it also worked with command lines. Unfortunately, it seems they were an Atari casualty before the TT. But I was able to do more & more quickly with Laser than with Lattice, and it had less missing (coming from a UNIX environment).

PeretzD@worldnet.att.net

2953. ST+ - Wow! You ought to get it!

Sorry to be advertising but the premier issue of the new paper-based ST+ Fanzine is now available in North America - and it is quite impressive. Everyone involved in the production should take a bow for a stunning debut.

If you'd like to see for yourself, here's a quick rundown of the North American distribution info.

Canada: Ken Macdonald - ken.macdonald@taf.tfn.org $3.00 CDN
US: - Computer Dungeon ($3.00 US (I think) & free with any purchase) - their email is comdungeon@aol.com - but I don't know if that can be used to get info on the fanzine.
- Terry Ross - tross3@hamtel.tds.net $2.50 US (expect a credit in the range of $0.75 - see my website or email me for details)
Mexico: Terry Ross $2.50 US ($0.45 US credit)

Note: Of course, the listed email addresses are just to get information on how to order - you have to physically order through the postal system.

Check out the ST+ Fanzine site for full information:
http://www.users.zetnet.co.uk/paxton/stp/index.html

or you can email me if you don't have web access - I'll try to answer your questions, no matter who you're ordering from.

Terry

2954. Help me remember this ST adventure game...

Newsgroup: comp.sys.atari.st
Date: 1998-02-10 00:00:00 UTC
From: bskendig@netcom.com
Message-ID: <bskendigEo59uD.DrG@netcom.com>
Source record: 107931

Several years ago, I saw an adventure game on a friend's Atari ST, and I'm trying to remember the name of it (so I can find it on the web and play it on an emulator!).

The game had a top-down view of terrain and buildings, and the player could manuver his character in real-time to pick up treasures and solve puzzles. It was *similar* to Gauntlet, but not exactly -- the graphics were much more rich, and I think the puzzles were more complex; I seem to remember reading cryptic signs, going up and down between levels of buildings, and being able to move back and forth between levels.

Does this tickle anyone's memory?

> (coming from a UNIX environment).

A "scurrilous" copy of Laser C came my way in 1990 while I was paying off
my Mega 4 and Megafile 60 hard drive.

Laser C was wonderful - it was fast, one-pass, (everything was cached in
memory) the debugger was source level (but one could easily switch to
debugging at the assembly language level) and could handle debugging
multiple input source files within the one executable, and the executables
generated by the compiler were quick,

Once I'd paid the computer and hard drive off, I went to a local Atari
retailer, and fronte up with the cash to buy a copy.

Unfortunately, they couldn't find one, or a wholesaler to source it from.
Megamax had either gone bankrupt, or stopped making Atari stuff by then.

I ended up buying Lattice C 5.06 about six months later. It was much
slower, the debugger wan't source level, and didn't allow inline assembly
language. It was ANSI-C, however, unlike Laser, which was K&R. It lacked
a builtin make capability, which Laser had.

I still pine for Laser C. Lattice C 5.60 is good, but I miss source level
debugging, and fast compilation (Laser C on the Mega felt about the same
speed as Lattice on the TT)

Does that also hold true for the Mega STe? I was given such a unit recently (only after spending hundreds getting my 1040 ugraded to 4 megs, ICD AdSpeed, etc,)

...but the Mega also wouldn't keep time between boots. Pulled out the TL-5242/W (3.6v) and have been carrying around with me. Which replacement is easiest to obtain?

And I also could use another Beetle mouse! The Mega strill has its original `tank' rodent.

JG

As this is a real bug I will fix it in 6.00. This is necessary in order
to show any program oder driver that indeed an FRB buffer has been
created.
I do not think that this will solve any problems, but it is a bug
to be fixed, nevertheless.

2965. [web] TT030 Homepage updated

Newsgroup: comp.sys.atari.st
Date: 1998-02-11 00:00:00 UTC
From: q-funk@megacom.net
Message-ID: <6bshjk$hq4$4@news1.tor.acc.ca>
Source record: 107742

Just uploaded the first part of a facelifted TT030 Homepage,
better looks, additional Stacy section, new docs on repairs.
Additional material upcoming when I'll find time to HTMLize
other documents I have sitting on my hard-disk.

On The MEGA/STE & TT030 Homepage, you'll find:

* General Info
- What are the MEGA/STE, TT030 and Stacy specifications?
- TT-Ram settings to allow specific SIMM combinations.
- When to use SCSI termination on external devices.
- Links to obscure or foreign makers of TT products.
* Hardware Hacks
- Adapter cables for 3rd-party monitors.
- Modem-2 upgrade to allow up to 230k bauds.
* Repairs
- MEGA/STE and TT keyboards manufacturing defects
that eventually kill your Control key.
- Finding a replacement for your realtime clock battery.

Thanks to Mario Becroft, Jo Even Skarstein and Frank Lockwood
for contributing some material for my page! ;-)

The TT030 Homepage: http://www.megacom.net/~q-funk/tt-home/

From: Martin-Eric Racine FUNKYWARE http://www.megacom.net/~q-funk
Atari TT030 12/48 NVDI 4.11r0, MiNT 1.14.5, N.AES 1.1.0, GlueSTiK

Unsollicited material will be proof-read for $100 USD per word,
payable within 10 days. Submission of your advertisement to my
address constitutes your formal acceptance of these terms.

>it under MagiC that I can remember.

Yes, it could be ... if I remember well I had a problem but not of
this kind ... the related Texel problem under Neodesk/Geneva was to
not being able to introduce formulas longer than the formula field
itself ... it doesn't happend under plain TOS.

I have just tried with the demo version 2 ... the same happend ...
not possible to complete a formula longer than the field lenght :(

Trying the demo of CalSL '98 in 32k colours, it doesn't seem to like this
mode, but this is only an early demo so maybe it'll get fixed?

Nolan is working on starting new Family restaurants in the California area called E2000's, they are supposed to be very similar to "Dave & Busters" which are very popular in the south. Basically its a restuarant with different areas to appeal to different people:

You have a Billards/Darts/Cigar area for the adults
A virtual reality arena
An arcade area
and of course the dining area, everything is on multiple levels and made up with a nice balance of fun and diversity.

Nolan is still on the board (I believe) at PlayNet, but I'm afraid its just not catching on like they had hoped for. He also still funds several companies that are part of the "Catalyst Group".

2976. What are the various jumpers on the MegaSTE MB For?

Newsgroup: comp.sys.atari.st
Date: 1998-02-11 00:00:00 UTC
From: kws@Radix.Net
Message-ID: <6bsthhemr1@news1.Radix.Net>
Source record: 107753

I was wondering what the jumpers do on the motherboard for the Mega STe. Already know about the dip switches, just wondering about the jumpers. I have heard that they can be altered to be able to use 2 internal floppies, and to also disbale internal floppies, and so on.

Thanks for the info.

2977. FS: Atari Network Adapter cards

Newsgroup: comp.sys.atari.st
Date: 1998-02-11 00:00:00 UTC
From: Curt Vendel <webmaster@atari.nu>
Message-ID: <34E1F554.A38EA57@atari.nu>
Source record: 107754
Cross-posted to:
comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.atari.programmer,comp.sys.atari.st.tech,ny.forsale,nyc.forsale

For Sale:

Very limited quantity network Adapter cards for the following Atari
Computer Systems:

Atari Mega ST's (MegaBus version)
Atari Mega STE and Atari TT030 (VME Version)

Note: The Atari Mega STE and TT030 slot can only accomodate (1) one
device, so if you are using a graphics card and want to also use the
network card this is NOT possible in a stock system

WARNING: Many Atari Mega STe's were sold with their VME PAL chips
removed, you will need to buy a set of PAL's and install then for these
adapters to work. To check and see if you have the PAL, open your Mega
STE and look at the 2 sockets close to the VME bus slot, if they are
present you are set, if they are missing you will need to contact B&C
Computervisions (Atari Sales & Service Center) 916-295-9270 or BEST
Electronics 408-243-6950 and order a set.

These cards are compatible with Linux, BSDnet/Atari, and Atari System V
Unix which all have the drivers to use these Ethernet adapter cards for
TCP/IP communication.

I have just recently acquired TOS drivers written by Atari Germany for
these cards, most of it is in Germany, but easy enough to understand,
the drivers are called TOS ANS (Atari Network Services), if someone can
upload these drivers to UMICH or someplace public I would like to place
these drivers up onto the Internet for everyones benefit.

Both versions (MegaBus and VME) are the same price:

Riebl Ethernet Adapters: $150 each (Includes 1 3.5" disk with TOS ANS
drivers and 1
"T" connector for the Ethernet card)

Shipping within the U.S. is $5.00 USPS Priority Mail, Shipping outside
the US via ground is $8.00, via Air is $14.00

NOTE: Quantities are very limited, please contact me by email prior to
sending payment to reserve a card.

2978. Display Question

Newsgroup: comp.sys.atari.st
Date: 1998-02-11 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <19980211195600.OAA01116@ladder02.news.aol.com>
Source record: 107755

While I might use Atari computers and run a retail store supporting Atari products, I still find that I have a LOT to learn about the computers.

A question about displays: I have a 1040STe (4meg, TOS 1.62) and have noticed in medium resolution that some of the displays that are on screen aren't displayed totally right.

For example, if I'm running STZip and extracting a file, it will display the first few file names right (as its extracting them) but them begins to put the file names over other file names it has already extracted so that it is hard to read what files the program is working on.

Or another example: I just tried out a program that converts currency amounts from one format to another, and while most of the screen is displayed properly, the amount that is converted (i.e. you are converting dollars to pounds, so I'm referring to the pounds display) is only about 10% visible on screen as it appears that part of the main display is laying over the top of this box.

I've noticed some other utility/app's that just don't appear to display properly on my setup; not all, just a few but its made me curious about this.

Has anyone else noticed this? Is this a common occurance in Med Res? Is the reason for the problem I'm noticing because these programs were meant to be displayed in Hi Res? Or am I getting more confused in my old age than I thought?

Sorry, for the long winded post but not sure how to explain it clearly (and I probably haven't).

Any help/info anyone could provide would be appreciated.

Al

>PC VGA monitor? Thanks.

```
Certainly not as VGA. The ST monitor can only display 640x200 in 50 or 60 Hz
mode. VGA require 70Hz and 640x400 I think.

Cheers,
Nick

David Knight wrote
>Stoop ran once Magic rebooted the system? This shouldn't (or least
>doesn't in my case) happen. Stoop loads, I select my MagiC
>configuration, Magic loads, resets the machine and continue processing
>the auto folder from after the MagiC program.

...maybe it shouldn't happen but it's totally normal all autofolder
programs are loaded after MagXboot. The easiest way to stop that behaviour
is to put AUTOEXEC.BAT into your autofolder. It's an ASCII-file containing
(any!) path and name of all programs that should be started as AUTOFOLDER-
programs under Magic. If Magic finds AUTOEXEC.BAT in Autofolder it ignores
every program not found in this file. Another good reason using
AUTOEXEC.BAT
is Magic's ability to start the included programs following their
appearance
row by row ignoring their physical order. So if your bootselector is the
physically first program in autofolder and Magic the second one the next
thing to happen after rebooting under Magic is to start all executable
files
included in AUTOEXEC.BAT. No bootselector in AUTOEXEC.BAT= no second start
of
it. The next times you see it is when you coldboot.

Short example:
AUTOFOLDER (physical order!):
XBOOT.PRG
MAGXBO32.PRG
MFP_TT.PRG
SCC.PRX
DRVIN.PRX
AUTOEXEC.BAT [*]
MFP.PRX
end of AUTOFOLDER
[*]AUTOEXEC.BAT is an ASCII-File, each row one path and program:
D:\OTHERS\MAGIC\FAX\FAXOUT.PRG
DRVIN.PRX
SCC.PRX
MFP_TT.PRG
MFP.PRX

would do:
XBOOT.PRG starts,
MAGXBO32.PRG starts, Magic reboots and reads AUTOEXEC.BAT
FAXOUT.PRG starts
DRVIN.PRX _starts_,

SCC.PRX _starts_
MFP_TT.PRG starts
MFP.PRX _starts_

Quite easy....

2982. TT Question

Newsgroup: comp.sys.atari.st
Date: 1998-02-11 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <19980211215600.QAA17569@ladder02.news.aol.com>
Source record: 107759

Is there any place on the Internet to go and maybe download a FAQ file
for TT owners? The file might answer questions such as:

How do you put in TT RAM?

What can you do with a TT that doesn't have TT RAM?
What more can you do with a TT that DOES have TT RAM?

How do you change the clock battery?

What monitors work best on a TT?

Mainly, I'm looking for a file that would answer questions that the new
TT owner might have.

Any help would be greatly appreciated!

If you want a free music sequencer have a look round the net for
Hollis Research Trackman which is free. The reason is that the
author who wrote it has moved on to other things and no
longer supports it. However, he is interested in seeing how many copies are
downloaded so only wants people to download it.

I am not going to leave myself logged on will I search through a pileof
magazines for the net URL. I am sure you can find it using
Altavista or similar

Hi there,

Short of writing a database application to do this, does anyone know of software on the Atari platfrom to do the following:

Run a business ! All the Inventory (sales/purchases) and invoicing stuff, printing reports, financials etc

Some nice wants would be:
Contains a simple accounts package (AR, AP P&L etc)
A Scheduler/Appointment package for customers
A Database for client info.

I've got PFM Plus which would cover the money side of things, but would prefer an all in one type package. It would be used in a hairdresser-type business.

Many thanks for any info or links you can provide.,

John E, Cash

Is there such an integrated package?

Many thanks,

John E. Cash

Hi there,
>I'm having problems with Cubase audio 2.03, the fact is that when I load
the
>songs from the SCSI HD or from the floopy some tracks are corrupted and
>notes are missing, if i try loading again the song 3 or 4 times the problem
>desapears.
I have never encountered this problem - are you running a copy or the
original? ;)
It's always best to have the latest update, which is CAF2.06 (and which
possibly also is the last one :((( ).
ftp://ftp.steinberg-us.com/dist/product_updates/ is where you get the
update.
Since the problem disappears after a couple of tries, you may have a problem
with the harddisk or faulty termination of the SCSI-chain.
Try to defragment the harddisk and make sure that the last and no other
SCSI-unit has a termination plug. Visit my homepage for hints about how to
make CAF run as smoothly as possible.

Best regards,
Claes

>I have just tried with the demo version 2 ... the same happend ...
>not possible to complete a formula longer than the field lenght :(

With MagiC you can use up to 255 characters. So, why only with MagiC? The answer is easy: MagiC is AFAIK the only system that supports long (scrollable) edit fields. If other systems would support long edit fields in any way (and I'd be given the programming documentation) I could implement this in ObjectGEM/Texel as well, but I will *not* write my own scrolling routines.

bye, Thomas

Sure, you have standard video, i.e. resolution etc. These pages have a fixed
width for instance, which is horrible for anything else but standard video.
The whole point of HTML is that the pages look well on all hardware.

> before. They are also under construction. so don't judge them to early.

They have big graphics, wasting bandwidth. IIRC they even put text into
graphics which is most stupid. They won't have done that if the final version
was meant to be different.

>> It's been the first time that I've seen somebody using white text on a
>> white background (!) It's ridiculous.
>
> Where did you find this? On your own pages? ;-)
> Seriously I couldn't find this anywhere at all. Tell me where?

All the following pages, for instance http://www.atari.de/messe.htm.
Someone said there was a background graphic, but even though I haven't
switched background graphics off, I did not get it. Still there is folx
who do switch them off, and they will definitely end up with white text
on white background, being utterly unreadable.

> BTW. Background colours looks to be something that they havn't masterd
> at all. Maybe it's a limitation in the webdesign program they use.

If so, the program should go into the bin. Still if they had to use it,
they would refrain from using color specifications at all, if they had
the faintest idea what they are doing (which they don't).

> for Atari users. Look at Wizztronics web pages. They are pathetic and

> is reading who?

What the hell are you talking about ?? The buffer memory is RAM, and it's
RAM before the buffer is created, and it's RAM after the buffer is created.
And RAM can be marked cacheable regardless if the RAM is used or not, and
it does not matter at all whether some buffer has been defined to be in it.

So what does "you wont be able to mark it as none cacheable as it's already
created" really mean ?? This caching is a hardware function, and the hardware
must be told which memory is to be cached, and why shouldn't you simply look
up where the MagiC code is located, and tell the hardware to only cache that
but nothing else (in ST-RAM) ?

Cheers Peter

Window shading is a completely different matter. It affects nothing the
applications are concerned with (for instance window work area, which were
changed by hard moves or iconify without letting the program know, but left
untouched by shading).

> iconify? I was talking about something taking over the system just like
> shading does. Alice does it, Freedoom does it, but I guess that is just

I knew you'd cite those. I suppose you're no programmer, because otherwise
you'd very much dislike them for the kind of dirty tricks these programs use
to achieve their goals.

There are some ST tuturials you might be able to download from an Atari FTP site, or check Nicholous Bales Quick FAQ web site (check one of his messages for the address). Otherwise, the Mac/Windows like GUI is intuitive, and you should be able to learn it just poking around. If you want a manual, I have a spare you could buy.

does atari offer any kind of support still, or is atari even
> in the biz anymore?

Some Atari clone makers. One in production, three about to come out with new models. No support if you don't you their product I'm sure. Some die-hard dealers offering support, like www.compdirect.com, www.infinex.com/~atycom/, www.myatari.com, and www.SystemsForTomorrow.com and many others.

the one system that i have working right now is, i
> think an st 40. the os seems a bit mac like with the gui. i have found
> where you set monitor resolutions and low and medium are greyed out only
> high is availible thus all my icons are tiny.

You only get low and med on a color screen. Some multisync monitors can handle all three with a special switchbox. Low good for games and paint programs. Medium useless if you have monochrome. (Better pic in mono for apps)

i figured this box had one
> hard drive, but when booted i see a and b floppy and c, d, e and f drives.
> is it partitioned?

Yes. Highlight each one and "Show Info" from menu to see capacity of each.

i have also hooked up this external atari hard drive
> which sounds and looks like it works, but after booted i don't see any new
> icon for it.

This should be the drive you are seeing icons for. 1040 ST has no internal hard drive.

if you know where i can find some tutorial type of info on
> operating the atari os i would apperciate it greatly. i am glad to say

This is the most common cause. For example, WenSuite, a currently
developed net browser obviously has mono and hi rez color users in mind
because the same problem you describe is apparent in ST Med, which it
seems few people use anymore.

I guess they were designed to run in Hi-Res. Bad programming, or lack of
beta testing are the culprits.

The PC has got telnet applications allowing ZModem transfers, and the Amiga
has a telnet.device, allowing any term program to connect via telnet and
download files via ZModem, so it is possible.

SC> Does anyone know what the specs are for the TT battery. I have a

Option 1
Some hearing aid devices use a 3.6V battery. Try finding one of these...

Option 2 (this is in fact how I got my clock going)
Buy a battery-holder for 3 or 4 penlight batteries (preferably type AAA, but AA will do too), you only need 3 penlight batteries. Remove the original battery and cut off the wire close to the battery.
Solder the wire on to the + and - of the battery-holder. Make sure not to switch the positive and negative poles. If you use a 4-battery pack you also have to modify it in such a way that it will work with only 3 batteries in it.
Place the connector back on the motherboard and stick your battery-pack on the back of the TT (this way it is easy to change them next time).

3007. ST Plus Fanzine Now Available

Newsgroup: comp.sys.atari.st
Date: 1998-02-11 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <19980211002801.TAA16139@ladder03.news.aol.com>
Source record: 107824

THE COMPUTER DUNGEON is proud to announce that we are carrying ST Plus Fanzine, the new print magazine for the Atari product line.

ST Plus Fanzine is a NON-PROFIT publication, meaning that no one receives compensation from the production or distribution of the magazine.

ST Plus Fanzine is a monthly publication that focuses on the Atari computer platform but will also have occasional articles on other Atari products.

The selling price of ST Plus Fanzine is determined by the actual cost to produce
and distribute the magzine. As more effective and lower priced ways are found to
produce/distribute ST Plus Fanzine, the selling price of the magazine will lower also.

The premiere issue of ST Plus Fanzine is 28 pages long and contains news, reviews, articles on the Internet - User groups -Emulators, letters, and much more.

Cost of ST Plus Fanzine is $3.00 which includes postage or FREE with any purchase from The Computer Dungeon.

To order ST Plus Fanzine call The Computer Dungeon at 708-547-7085 or visit or website at http://www.mcs.net/~isis/dungeon/dungeon.htm

I would personally like to take the time to issue a BIG THANK YOU to all the staff
of ST Plus Fanzine for producing an excellent and brillant first issue, and for supporting Atari products and those of us who use them.

Thanks for taking the time to read this.

Al Horton

: locked, I have no redress but ctrl-alt-delete. In fact, it happened only

Well, George, this is exactly what I am complaining about, actually. Having a multi-tasking OS is no help at all in this situation. The resolve can not be interupted in any way on my computer running Geneva. Not even pressing the Escape key has any effect. If I type in an address that cannot be resolved I must wait until the resolve attempt times out, which is an awfully long time. Sometimes I think I should reboot (I don't because I know the modem pool will be busy if I do that and try to reconnect).

I like Howard Chu's solution to the problem, spawn a small separate program to handle the resolve. This frees up the program the user is interacting with (e.g. CAB, Telstar, Newsie, or FTP) to respond to keystrokes while the other application is stuck waiting for the resolve to either work or timeout. If the user using the program does that something that requires another resolve, STiNG should be able to launch another copy of the resolve program and have it run too (after all, TCP/IP should be able to carry multiple packet streams, and I know STiNG can as I ahve used telnet and ftp simultaneously). I don't know if this would work under singletasking though. Perhaps if the resolver were part of the package in the autofolder so it loaded at bootup and was present, ready to do its thing. This might be something to do as an option so people who need the extra RAM could go the other way. But to me, it is so fundamental a need, I'd hardwire the thing that way.

Sounds very like an exploded electrolytic capacitor.

If you looked inside you would probably find that one of the
electrolytics (most likely the one in the primary circuit of the power
supply) is sitting in a puddle of black goo. It has leaked, the
insulation has gone and you are getting arcing (which will make it
even worse). It will only cost a few cents to replace. Look for any
other 'leakers' while you are there.

It could be something major like a flyback transformer, which is usually
not worth replacing. Try getting a second-hand monitor.

On the other hand, it could be something as simple as "dry" solder joints.
When I have this type of problem, I put the monitor aside for about 3-4
weeks so that most (or all) the electricity drains off (and even then,
I exercise EXTREME care around the transformer and flyback). Open up
the monitor, remove the "motherboard" from the bottom of the case, prop
it on its side, and start looking for areas where the solder has melted
away or has broken from constant heating and cooling (you will see
a small circular crack inside a round solder pad). Usually this is
around the high-temperature components (flyback, transformer, wires to
monitor picture tube, etc.). Your monitor may have its power supply
in a little box going up the side of the monitor beside the picture
tube. Again, check for "dry" solder joints after opening up the box.

Be EXTREMELY careful when working around the monitor because there
is a lot of high-voltage electricity in there. If you don't feel
comfortable poking around, then DON'T! It's much simpler to look
for a second-hand monitor.

Hope this helps,

Randy Kwak

3021. Re: IDE-HD on a Falcon

Use the laptop size ide hd with the miniature ide cable. The falcon motherboard has this connector, which also supplies power. There is a mounting kit to hold this, or you can rig your own. I got mine from www.SystemsForTomorrow.com for $19.

Hey! aclauss@rbg.informatik.th-darmstadt.de (Alexander Clauss) wasn't
it Thu, 12 Feb 1998 22:11:04 +0100 that you wrote:

>> When viewing Tables with CAB they seem to be transparent, even after I
>> set every cell background colours, still they are transparent,

Hello Alexander, Many thanks for responding, I didn't want to bother
you personaly with it, but as your reading ;-)

>You must have done something wrong ;-)

Possible

>Or you use a monochrome monitor and therefore can't see the
>colours ;-)

Your missing the point I dont care about the colours, I did
try on mono yes, Everything looks fine, the code seems fine It is
when I add a background gif, this then comes through the table,

A regular visitor to my page who uses CAB 2.5d said he was using
Medium res and the background made the text impossible to read? But I
am using tables and the table properties set the colour like so?

If I want a cell to have a different colour then I use the bgcolor
properties in the TD tag,

This will show the correct colour on colour browsers, But add a
background picture in CAB med or high rez on a ST and it becomes
transparent,

I test my web pages using
Netscape 4 MIE4 Cab 1.5 Cab 2.0 demo and CAB 2.5d

If you have time (and my utter apologies if I am wrong) you can check
my web pages at http://www.users.zetnet.co.uk/paxton/ view the source
its cleanly written and set out for people to read :)

Still, it may not help much, since many bank WWW frontends are set up by
idiots, who only check for Netscrape or MSIE, despite that there are other
browsers with SSL support. What is important is the SSL connection, not the
browser, but many banks fail to understand that.

Hi Brian,

I've been wondering about the Syjet drive myself. How well does it work for audio recording? How many tracks at once, etc.? (Aside from the problem you mentioned). I would suggest you take a look at a shareware disk defragmenter/optimizer/fixer-upper called ZORG. It's on most of the ftp sites - the latest version I've seen is 2.08. It's worth a try. Please let us know what results you have. I, and I would think several other people, would be very interested in your results. Good luck.

Hi!

sorry for errors, this is my first time posting in an international newsgroup ;-)

> SC> Anyway, the next thing I want to fix is the battery. The clock
> SC> hasn't been keeping time since I got it. I looked at the battery and
> SC> it says it's a 3.6V.

Since I start reading mails today, I didnt get the initial message.
Anyway, the battery voltage depends on the TT version you have.

TTs with CPU on daughterboard or PGA socket on mainboard need a 6V battery, those with their CPU soldered directly on mainboard (located left of ST-RAM) need the mentioned 3.6V.

So first go and take a look at your mainboard.
You say that the clock hasn't been keeping time since you got it - so I think you need a 6V battery and someone put the wrong battery on your main board.

The easyest thing to do is to look for a battery holder suitable for PC compatibles. It is prepared for 4 1.5V batteries in mignon style and has exactly the same connector as used in the TT (4 pins, pin 1 is +).
The pinout of J400 is:
1 +6 or 3.6V
2 nc
3 ground
4 ground

A standard 4x1.5 battery holder will do as well - you can even use rechargeable batteries instead, but you have to modify yor TT a little to obtain charging voltage;-)

Greetings from Germany

Dietmar

BVT> Same..... ST GUIDE
BVT> - What is the latest version of this program and where do I find
BVT> it?
>>

Hi Brian,

AFAIK Photochrome was suspended a long time ago, SOL ditto, Stuart Denman left the Atari scene after releasing v. 3.8 and started working on the IBM platform (at least, that's what he told me a few years ago).
Gemview is/was at v. 3.17 AFAIK, but the save JPG option is only available when running in Truecolor, when I'm doing 256-colors it ain't there...
And as far as I got the msg, Mr. Vollbeding is residing on another planet.

There's some commercial packages which save in JPG, and there's Graftool (shareware which "costs" you only a message to the author saying you're using it and you'll get a key, but it doesn't save in JPG. It supports TIF, PNG though).

Looks like you're not using a GFX card, then I suggest you should give Graftool a try... on 16 color screens output is close to SOL/Photochrome!

For AVI/MOV (Apple QuickTime) I prefer Aniplay. I forgot how it worked in TT medium, but in 256 colors or Truecolor it's perfect. I recall v. 1.20 has been released recently.

Don't know about North America but here in the UK I think MSN is being wound up. I understand (from a news item in Personal Computer World, IIRC) that MSN will end up just as a web site, and they are dumping all of their network/connectivity/ISP stuff. Seems like AOL/Compuserve won (now there's an equally scary thought...).

What I know about Z-modem can be written on the head of a pin, but FTP
will continue an interrupted download as long as:

a) You don't quit the FTP app and it doesn't time out while you
reconnect the phone link.

b) The other end doesn't time out while you are doing a).

The same goes for most other TCP/IP-type connections IME, eg mail and
news transfers.

Sometimes you can wake the connection up quicker after re-establishing
the link by pinging the remote host just to let it know you're there.

Hi you need to turn on the drive arbitration in HD Diver. I use an
external fireball 1.2g on the scsi port works great. You will need
HDdriver v6 or even better V7x In the set ID put it a 7 The computer
cannot boot off arbitrated drive (YET) unless you use the link 97 on the
dma port.

Hallvard Tangeraas (hall@post1.com) wrote:
:
: In order to transfer files with a PPP connection you need to use an FTP
: program (FTP=File Transfer Protocol).

Hallvard is right. You can't use sz to send yourself a file using z-modem protocol because that protocol wasn't designed for use over a PPP or SLIP connection, it was desigined for use over a dialup connection. If you are using STiNG or STiK then you are using PPP or SLIP so you need to use the appropriate file transfer tool, which is FTP. More's the same, as I don't think FTP supports the ability to finish downloading an interupted previous download the way Z-modem did.

: Unfortunately I haven't gotten any of them to download files from my own
: "home" area (where my homepage is etc.).

I would suspect soemthing in the way your local ISP is configured, since you can ftp from other sites. I have had consistent success downloading from my own "home" workspace using A-FTP and, upon occasion, Newsie. Also, I hear the newest CAB will come with support for the FTP protocol.

sigh Why do people reply without knowing/reading the context and/or
knowing what they are talking about?

MagiC /ignores/ the NV-RAM settings for the boot resolution, so Stoop won't
work in the Auto-folder once MagiC is active, as the machine is now
running in ST High. Got it?

Ciao

>
> Use autoexec.bat (=> Manual).

If you refer to placing it physically in front of stoop.prg, OK, that can
be done using autoexec.bat (but it would be wise to do the old fashioned
way, as it then would cause no problems when booting with plain TOS,
either (though there is a possibility to use autoexec.bat for plain TOS,
too)).

But using autoexec.bat to just disable Stoop under MagiC maybe isn't what
helps Michael, as he certainly wants to use Stoop with MagiC.

Ciao

Hi!

In article <34e105641f3d002@club-internet.fr>,
pricard@club-internet.fr (Pascal Ricard) writes:
> What is it please ? I don't see a word about this file in my manual.

It's a text file placed in the Auto folder which contains program names,
one per line. If it exists, MagiC will use it to run Auto programs (in the
order they appear in the file), rather than the contents of the real Auto
folder.

As MagiC simply ignores non existant filenames placed in autoexec.bat,
it's still possible to use a boot selector. Just put all programs in the
order you need them with the suffix .prg in the file, and disabling the
actual files by changing the suffix into .prx will still have the same
result.

As the idea of having such a file would also be nice to have for plain TOS
or MiNT, there's the utility AutoMore which (besides a lot of other
things, e.g. pausing screen output during Auto folder execution on demand)
offers this possibility (and also extends the concept a little). Note,
though, that it has no English docs yet (but English program messages and
configuration directives). It may be found at
ftp://ftp.uni-kl.de/pub/atari/incoming/automrr6.lzh

Hi,

Here is my version of what Magnus is trying to say.
MagiC will not run (reliably) from Fast Ram on the Afterburner or a MightSonic.
Period. (TK5XX).
The problem is not with the Falcon, Afterburner or MightySonic.

I would like to hear if it can be loaded into alternate ram on
an FX card. If I remember right, it can't. That would seem to include
all other "alternate ram cards" for the Falcon as well.
(The starting address for the alternate ram on an FX differs from
the A/B, M/S and TT which all begin at the same location, FYI).

Both the TK Rom driver that Doug wrote, and FAFAXX.PRG (add memory app)
from GE Soft create an XFRB, and places the starting address of fast ram
the same as on a TT (to repeat myself). One is not to use the option within
HD Driver to create an XFRB with the two cases above. The XFRB created
with the TK Rom Driver and FAFAXX cannot be cached, or over written.
This XFRB MUST be used for all DMA between fast ram and ST RAm (A/B and M/S).
99.5% of the applications I use are wrote to recognize this "standard"
way of implimenting the XFRB buffer. Linux, MiNT, TOS (4.04-4.92) all work
perfectly well with it too.

For whatever reason, there is a compatibility issue with MagiC here.
The point is not really worth mauling over as it is very clear that it
will never be resolved by the programmer as he dosen't recognize it as
a problem with his software. I'm sure with the credit of such an application
as MagiC, he is fully aware of what is going on, and possibly how to
resolve the issue. For whatever reason, he is not being allowed to do
this.

I may be off on a few technical points, but the general facts are
accurate.

And that's why I don't like it ;) I prefer mutt for eMail and knews for UseNet. Both support threading (yes, mutt can thread mail folders and displays a message tree, which is very useful for mailing lists) and MIME. knews also supports inline images, especially useful for regular readers of the alt.binary.pictures.* groups ;) And I can't say tin's threading feature is better than that of knews. Of course, knews is X11 only, so not useable with TOS (I know about the X port for MiNT, but it's IMO too experimental for any serious use). mutt has been ported to MiNT-Net, though (but maybe not the latest version).

Ciao

tin 1.4 has mutt-like threading, i.e. a message tree. Very nice
indeed! I don't like mutt that much though, I guess I'm just getting
used to pine. However, both are way better than any GEM/Windows/MacOS
mail-readers I've ever seen.

> of the alt.binary.pictures.* groups ;) And I can't say tin's threading
> feature is better than that of knews. Of course, knews is X11 only, so not

tin 1.4 is only beta, I've compiled a fairly recent one and uploaded
it to ftp.funet.fi if you want to try it. It's a 68020-> binary
though, if you have a 68000 I can build a pure 68k binary as well.

Yes, but a boot program (if used) have to be ran *before* magxboot and not
after it. I've no problem at all with Stoop v1.05b *at boot up*. When
magxboot is launch, it performs a warm boot (right ?) and Stoop should not
run again after a warm boot. The only drawback I have is that Stoop don't
run on Magic (to modify its config, etc...) but it's not a great problem.
If I want to do so, I get a message: "stack space exhausted" then error 39
"mï¿½moire insuffisante" (in French). I just don't use it that way and all
is good.

BTW I don't use Stoop v2.x 'cause I had crashes with it in single Tos.

3054. SYJET DRIVE

Newsgroup: comp.sys.atari.st
Date: 1998-02-12 00:00:00 UTC
From: jagger@power.connexus.net.au
Message-ID: <34e30c40.0@news.internex.net.au>
Source record: 107706

I use a Falcon running hd driver v7.00 and a syjet 1.5 gig removable drive
for hd recording. The Syjet is partioned into 2 x 715 meg partitions.
I recently tried to view a frag map of a partition with 200meg of audio
data, in diamond edge 2.04, the frag map showed only one tiny green dot of
used space, but edge showed it 30 percent full on the bar graph.
I then ran disk medic which came up with 6,900 lost clusters, i selected
fix and lost quite a bit of data, most of which I now have back.
I then formated and partitioned abrand new disk and copied 100 meg or so
of data to it, the frag map was exactly the same, one tiny green dot.
Medic showed 7404 lost clusters, did a fix on that, ran medic again
and it came up with 230 lost clusters, fixed that too but frag map still
the same. Otherwise the drive seems to perform excellently!
I have double checked my hd driver settings, they seem to be correct.

Does any one have any ideas on this?
Is there a later version of Diamond edge 2.04, or another prg
that can sucessfully handle this drive?
Any ideas would be greatly appreciated, it seems impossible to use a hard
drive for professional audio if I can't defrag it.

Jo Even Skarstein <joska@pingle.nvg.ntnu.no> writes:
> tin 1.4 has mutt-like threading, i.e. a message tree.

Did I deny that, or is tin now also able to read mail? I wanted to point out that mutt offers threading for eMail, and not just that pseudo-threading recent versions of pine have (AFAIK).

I also like the additional support (besides the already mentioned threading) for mailing lists found in mutt, e.g. have different config files for certain folders, reply to mailing list mails without having to care to send to the mailing list's address only, etc.

But of course if you're used to pine and like it, I won't bash you for that ;)

> However, both are way better than any GEM/Windows/MacOS
> mail-readers I've ever seen.

Yes. I prefer reading and replying eMail without having to use the mouse all the time, too. Note, though, that I don't use any of the named programs on my Falcon, as I usually read news and mail at the university, on a Linux box.

> tin 1.4 is only beta, I've compiled a fairly recent one and uploaded

3057. problem w/ HD DRiver/ICD w/ Quantum Fireball 2.1 and TT

Newsgroup: comp.sys.atari.st
Date: 1998-02-12 00:00:00 UTC
From: Nima Montaser <nima@nortel.ca.DEATHTOSPAM>
Message-ID: <34E31A86.443D@nortel.ca.DEATHTOSPAM>
Source record: 107709

Hi,
I was wondering if anybody has ever come across this problem.
I have been trying to install a brand new Quantum Fireball SCSI
2.1G on a friends TT TOS 3.1, but I have had no luck:
He BTW wants to use it for Cubase Audio D2D recording.

I have used ICDPRO v6.5.5, HD Driver 6.1?, ATARI driver (ARGHHH!).
Here is what happens:

Upon starting the system, HD driver doesn't even see it. Its ID selector
doesn't even see it. Very strange.

ATARI's driver fails to see it too.

However, ICD's driver and ID selector sees it with no problems. ICD can
format and partition without any problems and I can install the driver
on it.
However, ICD is not compatible with Cubase Audio.

I assume that HD DRiver v 6 is (anybody knows??)
I can only run HD DRiver after I have booted with ICD. (I double
click on the program from the desktop)
In which case, both HD DRiver and its ID selector program see it just
fine. (i.e, after having booted with ICD) This is very strange.

Lastly, when I run HD DRiver after ICD, Cubase doesn't want to recognize
the key.

As a final questions, does anybody know what driver can be used
for running cubase Audio on such a drive? What is the max partition
limit?

Any help is appreciated.

3059. IDE-HD on a Falcon

Newsgroup: comp.sys.atari.st
Date: 1998-02-12 00:00:00 UTC
From: atari@hem1.passagen.se
Message-ID: <6bv8cnnvp1@cubacola.tninet.se>
Source record: 107711

Hi all!

I use my Falcon with several SCSI-units.
Can I use a internal IDE-drive as well to boot with?

What modifications do I need to do or is it so easy that I just have to open my machine and plug-in the IDE?
What about its power supply etc?

What dimensions should a drive like this have?
I use the original Falcon/ST case.

..and I still use AHDI.

The background:

It takes ages to boot MagiC 5.20, before the systems finds my SCSI-units. I was in touch with Daniel Hedberg about MagiCPatch, but it will take some time to develop a new one.

If a crash appaer, I will save my SCSI-HD.

I don't have to turn on the SCSI-units if I'm going to play a game etc.

Best Regards

->Later,
-> James

Bravo! Good for you, James! Nowhere is it written that just because we are in the minority, that we have to take it on the chin, so to speak!

Just sat my Nemesized Falcon down in front of one of my PC owning "friends" and compared demos... Not familiar with the PC demo scene so I can't give you names but he showed me 5 or 10. Then I showed him Joint-Venture, The Lost Blubb, Sonolumininesence, Sili-con Carne, Hydroxyd, Ignis, Eggstasy, Firestarter, Scarface, and finally the 2 new ones from The Dead Hackers Society -- Liquid Fire and Dream Dimension...

His PC demos were okay, but ours were definitely a match and more...Then we compared hardware..He was running a P166 with 32 megs of Ram. He was amazed at what the Falcon was capable of doing with its stock hardware.

I think what really got his goat though was the fact that I ran all of my demos straight from my Geneva/NeoDesk desktop, without any exertion at all...Needless to say, he had to re-boot several times (to clear out memory-his words, not mine), and most of the demos had to be run from a "clean" system, without anything else running... <big grin>

->Sorry, I've got to post some old answers of me, since they never
->appeared in this newsgroup due to a gateway that's not working properly.

No problem, thanks for your reply!

->What version of GEMJing do you use? The latest version is 1.06. Download
->it from my homepage.

I'll have to look, but its the version that comes with Cab v2.5. I'll
d/l that today, thanks! ;-)

->Oh, you have no pre-emptive Multitasking? Otherwise you could change the
->link and CAB will stop GEMJing playing.

No, I don't have "pre-emptive" multitasking, but I do have co-operative
multitasking with Geneva/NeoDesk.

Thanks again...

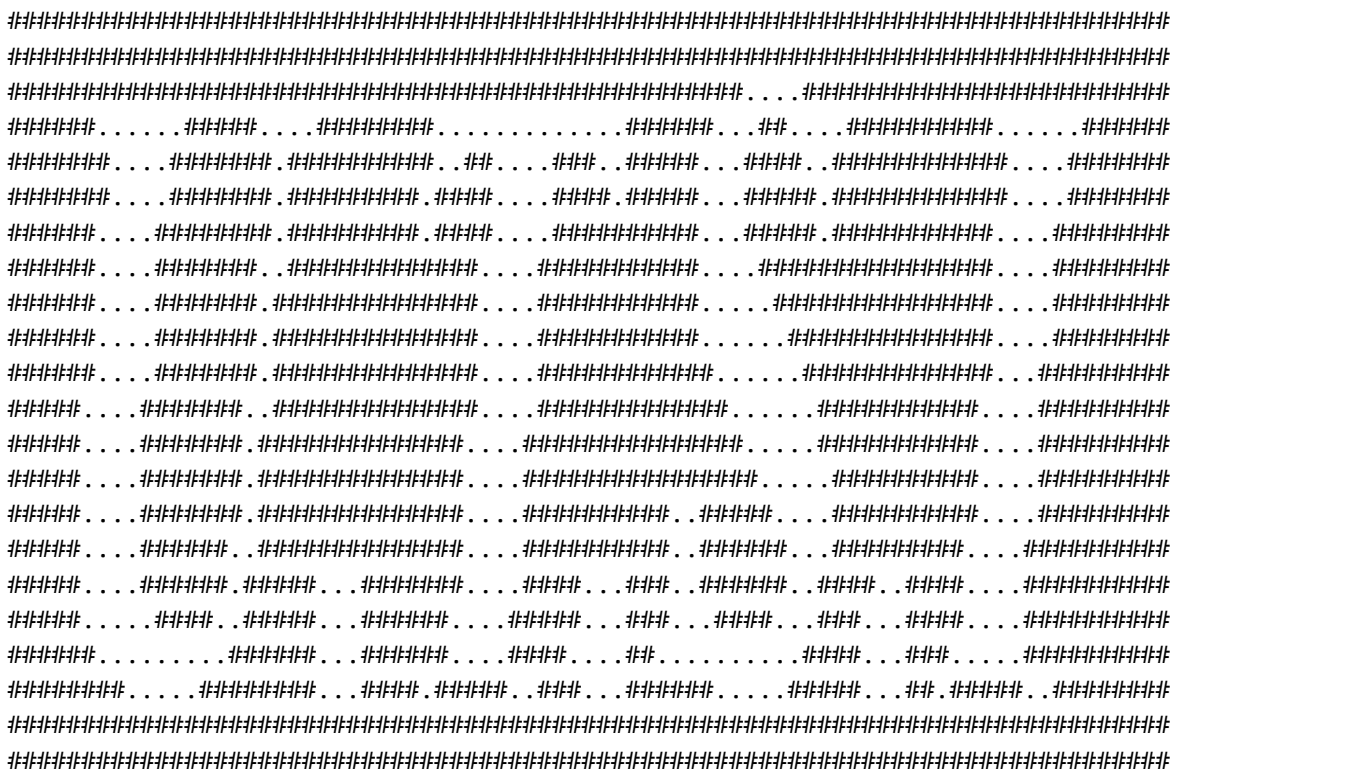
3062. [WEB] U.T.S.I update 12-02-1998

Newsgroup: comp.sys.atari.st
Date: 1998-02-12 00:00:00 UTC
From: dipching@ping.be
Message-ID: <6bv94pfoi2@news3.Belgium.EU.net>
Source record: 107714



Hello everyone, you can now find about 673 atari programs url links in
the U.T.S.I ...

A new page has been created and can be accessed from the main U.T.S.I
page ... it's called GRAPHIC LINKS page and is just about showing the
main atari companies (resellers, developers and so on) with graphical
links ... you'll find there the companies logos ...

Note it exist only one place (for the moment ...) from where you can
access this new page ... it's at PRG-IND2.HTM

Also thanks to everyone who is participating at the UTSI when sending
their remarks, found wrong links, contribution and so ...
THANK YOU very much for all these friendly people who are ALSO
maintaining the U.T.S.I

Jo Vandeweghe

->displayed in Hi Res? Or am I getting more confused in my old age than I
->thought?

Med. Res. does cause a problem with some apps/utils. Selectric, the pop.
file-selector replacement util. immediately springs to mind...

Al, if you are going to be using this particular computer for the business
end of things, you'd probably be better off picking up a cheap SM124 any-
ways. You'll get more on-screen info and better res. to boot. Just a semi-
random thought... ;-)

I have an STe with a hard drive.
Years ago I had a STf with a hard drive, but as far as I can
remember the hard drive only rotated when it was saving,
and stopped spinning when it had finished.
My present hard drive spins continuosly and I would prefer
it not to.
I am using ICD software/hardware.
Any ideas or is my memory of the quiet hard drive incorrect?
All hints ideas welcome.
My Email address is davyl@enterprise.net - or post to newsgroup

Thanks,
Davy Lamb

3070. Re: IDE-HD on a Falcon

Newsgroup: comp.sys.atari.st
Date: 1998-02-12 00:00:00 UTC
From: drojo@marlin.utmb.edu
Message-ID: <6bveq6rgk1@allele.utmb.edu>
Source record: 107722

Hi Mille.

: I use my Falcon with several SCSI-units.
: Can I use a internal IDE-drive as well to boot with?

Yes, you can.

: What modifications do I need to do or is it so easy that I just have to
open my machine and plug-in the IDE? : What about its power supply etc?

It's absolutely straightforward, I did install an IDE drive on my
falcon... the only thing you will need is a connector cable. The power
lines are included in the connector and this drives are not power hungry,
as they are designed for notebook computers. There is a HD installation
kit around, with the mountings and screws included... ask to the Falcon
Pro Center...

The only thing I don't know is how to know the right orientation
of the lines as the connector is symmetric. When I installed mine I just
trust in the 50% chance that i'll be right, and it worked!, but this is
not a good advice ;-).

: What dimensions should a drive like this have?
: I use the original Falcon/ST case.

It should be a 2.5" notebook drive. Note that a standard IDE drive will
work, but probably wont fit easily on a standard case. In this case a 2.5"
<-> 3.5" drive adaptor is required.

: ..and I still use AHDI.

No problem... unless it is an old version (well, all of them are :-)...
but I mean under v.5).

: It takes ages to boot MagiC 5.20, before the systems finds my
: SCSI-units. I was in touch with Daniel Hedberg about MagiCPatch, but it
: will take some time to develop a new one. If a crash appaer, I will save
: my SCSI-HD. I don't have to turn on the SCSI-units if I'm going to play
: a game etc.

You will get a quick boot with the IDE :-)

Hope this helps.

Daniel.

There is a fix for MagiC that solves this problem I've forgotten the name
but it is Magic not AHDI that is the problem, It takes too long looking for
the IDE before SCSI. The patch fixes it So you dont have to get the IDE
drive after all :-)))

h> many people still use programs which relies on old standards which
h> have been decided on (I believe Peter (correct me if I'm wrong)
h> mentioned an RFC document where this was mentioned).

From my point of view, Atari programs could line-wrap in 1986. When I talk
of 'stone-age' I refer more to the mentality of the program design rather
than date it was programmed.

h> It's great if new features can be added on the mail/news *reading*
h> side of it, but adding proprieatory features when writing message is
h> pretty lame in my opinion. Just have a look at the HTML feature of
h> Netscape -I'm sure I'm not the only one who has become irritated by
h> people posting messages in HTML.
h>
h> I guess the next thing will be a new mailer from micro$oft where mail
h> is written in Word format, so that everybody should be forced to use
h> the same mailer as them ;-)

On the last point, I know I've seen Word format documents posted...

On the first point, yes I agree that using HTML in message areas is too far a
diversion from the standard to be acceptable without a new RFC, but the point
about line wrap is that the text remains in ASCII without control codes of
any type. I don't think this is too dramatic a departure.

h> However flashy new software may be, they shouldn't forget about the
h> users out there who don't have these features. After all, doing email
h> and news is communication between two or more people, and what kind
h> of communication will it be when each person "speaks his/her own
h> language"? just a thought.

I don't think there is a platform anywhere whose software is *incapable* of
handling line-wrapped ASCII if it wanted to.
```

>> Nevertheless, it is true to say that ASH are failing to support the
>> existing standards and should not really invent their own...
h>
h> That's exactly what they're trying to do, designing their own
h> standard for PPP connections to begin with. Plain stupidity if you
h> ask me!

I don't know anything about a new PPP standard, so I can't comment on that. However, it isn't the first time that an ASH product goes its own way and sticks two fingers up at any acknowledgement to accepted methods - both NVDI and Magic have been criticised in that respect long before CAB.

Stupidity is not a term I would use...

h> Are they trying to become the micro$oft of Atari/TOS computers?

..a certain arrogance, though, is very apparent, especially when it flies in the face of an RFC. In the limited world of Atari I'd say yes, programs under the banner of ASH do seem to have the same approach to its market as MicroSoft, but their products and authors lead the way in so many things it's hard to be surprised or to blame them tbh.

I would say that it's down to ASH to make their EMailer write with any line length showing on screen that they want, but to convert it to a maximum 80 character length on saving/exporting. They can fly in the face of the Atari market, but are unjustified in flying in the face of an Internet RFC.

However, a reader program worth its salt ought to make the issue academic in this day and age. This should not be an issue with software on as mature a platform as we have on our Atari machines.

B^{)

y> Surely, if your mail reader is smart enough to wrap lines to fit your
y> reading area, it is also capable of ignoring a few stray cr/lf
y> embedded in there for the benefit of us dinosaurs.

It is. I have no problem with either method, myself.

y> Also, I'm sure your text editor is capable of wrapping lines and
y> inserting end-of-line characters where needed. Some other
y> people's editors apparently don't. Old, outmoded software, no
y> doubt. ;-)

I have to say, I find the output from your own messages aggravating, because the lines end with a <CR> but no <space> character immediately preceding it. My reader takes this as a paragraph ending and will not allow me to read it in 85-column mode. I can live with it though...

When replying to your messages I actually go out of my way to reformat them to a longer line length, so the overall message covers less lines while falling within the maximum line length allowed. I do it as I re-read your message and I've got to the stage where I'm very fast at it, so it's not too much of a chore. I wish I didn't have to though.

What software do you use? Can the author update it?

y> Ascii e-mail/usenet has been around for a long time, and AFAIK proper
y> text formatting was always the responsibility of the sender. There
y> is still a large body of current software that works that way. So,
y> unless you're Microsoft or Netscape, why would you want to change
y> established usage just to break other people's software?

In principle I really *do* agree with you. In practise I would have hoped that reader software was of sufficient quality nowadays to make it an irrelevance, as I said in the last message. I've suggested a method to be used by the sending software that would cover both situations.

>> Nevertheless, it is true to say that ASH are failing to support the
>> existing standards and should not really invent their own...
y>
y> Precisely. Standards do change, but there's no need to be obnoxious
y> about it.

I sympathise with your point of view, but speak to your own software author
anyway...

Hi All

After some people not being able to gain access to the place of the last
meeting due to Brian being on the top floor, the next meeting will be held
at...

14 Camberly Mount
Holmewood
Bradford

on the 15th Feb 98

Anyone wanting details on how to get there please telephone 01274 826353
anytime before 9pm.

The door will be open from 1pm to 6pm ish.

Anyone wishing to bring there computer along can do so, and if you arrive an
hour early thats fine as it will enable you to get it set up before the
meeting.

For the first time there will be a small charge for refreshments of tea or
coffee (about 30p) per person.

Being in the industry, and selling WC's I will not use M$ software
(except the OS) on my machines. Nor will I use intel's CPU's. I cant see
how intel could live without M$. Linux and OS2 couldnt keep them afloat.
Bill gates has already gone rouge if you ask me. A world without choice
is not one I particulary want to live in. Pirate copies of Windoze is
the only reason Bill won. Hence I refuse to be bullied into spending
heaps on a machine that is no faster or better than my Falcon. I have
used Atari's since around 1983, I have used (and own) just about every
other computer too, but always come back to the Falcon.

3089. Redacteur?

Newsgroup: comp.sys.atari.st
Date: 1998-02-12 00:00:00 UTC
From: br946@torfree.net
Message-ID: <Eo8oI8.Hq6.0.sheppard@torfree.net>
Source record: 107785

I'd like to locate a used copy of the word processing program Redacteur for the Atari. My father and I use both Ataris and a Mac in connection with various writing and research projects and we'd like to acquire a more powerful WP program.

At this point I have little need for extensive graphics features or dictionaries, so the stripped-down "junior" version of Redacteur would suffice. I need a fast program which fully utilizes the typefaces resident in our HP4M laser printer. I would use Redacteur with an STe which has 4 megs of RAM. I have a second disk drive but no hard drive.

I understand that one should obtain at least version 3.15 as earlier releases of version 3 can present problems. I'd need the English version of the program along with the accompanying manual.

If you have a copy of Redacteur you no longer need, I'd appreciate your e-mailing me details regarding which version of the program you have and your asking price, including shipping costs to Toronto.

Thanks very much.

Only indirectly. From what I've heard they'd do it, but they require some
kind of BSD sockets. So hopefully when I get the BSD library working, this
can be worked out.

Cheers Peter

> Sorry to interrupt, but would YH be so kind and define the word "standards" in
> terms of e-mail clients, please.

Sure. The Internet has it's own standardization "council" (the IAB, Internet
Architecture Board) which is an independent group of people. They have pretty
tough requirements before anything can become a standard. Usually, when some-
thing new is developed, it's specification is posted as an RFC (Request For
Comment) in the Internet. Everybody can look at it, suggest changes, and test
it thoroughly. After a lot of experience has been gathered, generally a second
or even third version is specified and then posted as an RFC. On the way, the
"standards track level" increases from a proposed to draft standard before it
becomes a full standard eventually. The general process is described in form
of a standard itself. All protocols on the standards track are available as
separate documents, to be identified by the standards number.

All the documents can be downloaded from ftp.internic.net where they usually
appear first. RFCs are in the /rfc directory, while standards documents are
in the /std directory. A list of all RFCs can be found at

ftp://ftp.internic.net/rfc/rfc-index.txt

The up-to-date list of protocol status and more details on the standardization
process are in

ftp://ftp.internic.net/std/std1.txt

Now e-mail is only one single topic on which standards have been developed.
Check out the mentioned documents for more.

Cheers Peter

Netscape® Communicator 4.04 (on SunOS at least) has a checkmark
"Always use my colors, overriding document"; it doesn't override
FONT COLOR though, which can easily result in disaster. :> And
their presentation in "images-off" mode is still awful - give me
CAB's "Text statt Bilder" mode any day.

In many respects CAB is the best GUI browser I know. And I'm talking
about v1.5! What was ASH's telephone number again?

I have a selection of Atari ST titles for sale.

This List Updated 13/2/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
SCSI external CD-ROM drive, Atari CD ROMS, 16-bit sampler
cartridge/hardware etc...

All are on original media. I may be interested in part exchange/swap W.H.Y.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

>>>>>>>>>> All prices are in UK Pounds (sterling) <<<<<<<<<<
^^^

Prices DO NOT include postage.

GAME COMPILATIONS

Hollywood Collection (5d,ni) 4
Ghostbuster II, Indiana Jones and the Last Crusade & Robocop
TNT (4d) 5
Xybots, Toobin, APB, Dragon Spirit and Hard Drivin'
Finale (4d) 5

3095. Magnum ST Memory Upgrade...

Newsgroup: comp.sys.atari.st
Date: 1998-02-13 00:00:00 UTC
From: kws@Radix.Net
Message-ID: <6c21gu$5ob$1@news1.Radix.Net>
Source record: 107591

I was wondering what experience anyone has had with this upgrade. I am interested in getting it for a Mega STe, but would first like to know how well it works, if it actually adds an additional 16 megs of RAM, the type of RAM it prefers (I know it takes a 72-pin simm and has an MMU on board, but does it use 32 bit or 36 bit or EDO, and does it take 16 as a max, or can it goto 32). I am also wondering how easy or hard this unit is to install and if it requires a specific version of TOS (Its going into a Mega STe with 2.05).

The only people I see who have it for order is Woller & Link over in Germany. As I do not speak German, and can't read it either, I was wondering how complicated it is to install, or is the install pretty straight forward. Also, does anyone have a contact email address for Woller & Link, I can't seem to find one on their web page, but it is in German, so I might have overlooked something.

Thanks!

tut - tut :-) Hold on there, help may be at hand.

I also found it frustrating to get up and running just from the
programmers notes, so I resolved it myself (no pun intended)
Have just completed a Guide, after 12 months hard work, and a lot of
time - namely "Users Guide to the Internet for Atari"
It's aimed at the beginnner\novice wanting to get a 'net connection,
and covers installation and setting up of the Atari programs.
i.e.
Ant mail\STiK\STinG\CAB\Newsie\Oasis\Telnet\FTP\IRC etc. Also notes on
emails general\junk mail\newsgroups\search engines\netiquette etc, etc
Dial scripts are included as well as screen shots to follow.
If you want a full list of whats covered, email me for more info.

|I've tried to email him, using the address given in the docs but has had no
|reply. Has anyone else had better luck, or has he stopped supporting the
|program?

Ah! So you are having trouble, too, Hallvard.

Yes, it's a great program for setting up what is a rather complicated
ASCII script and I was very keen to get myself registered.

I went to Heiko Schaefer's home page and was utterly DISMAYED to find
a message saying 'Don't ask me for keys as no more will be
distributed'!!!!!!

This is madness! If he has lost interest in the program he should
release an unrestricted version.

If anyone is reading this who knows Heiko it would be a good thing if
you could persuade him to stick an unrestricted version on his pages.
There are a lot of people who could make good use of SMU-Set-up but
are being denied the opportunity.

|Also, is an English version available? The German version works fine, but
|an English one would be even better.

No I don't think there is. If an unrestricted PD were available I
would translate the important parts but this is a bit pointless if all
we have is the crippled version.

:-(((((((((I was upset, I can see you are too.

Yup. This SCSI termination is a prob. on the TT, I wish there was a
solution which made sense.

I set up my config. as (theoretically) correct:

Terminate internal
Remove internal termination at bus outlet
Terminate last device in external SCSI chain

This was awful!! Loads of bus errors. I had to put back the internal
termination of the bus outlet.

I have seen people write that the T-bus (as on the TT) is difficult to
terminate properly but I would have hoped there was better guidance
than 'try it and see'.

I don't know where I found my copy but mine was called
freemint-1.14.6-bin.lzh.
Maybe you could try to rename your copy in 'freemint.lzh' and unpack
it with lzhshell.app or lharceng.ttp.
My copy contains some long filenames so it's maybe better you unpack
it on a minixfs partition.

Hi,
The termination portion is OK since ICD sees it and once ICD sees it,
HDDriver sees it as well.

Jo Vandeweghe wrote:

Source record: 107606

in order of cubase audio 2.0 manual I had do in my atari falcon 030 the
following
suggested modifies for decrease the input audio internal port gain:
I had removed R56; R57; R90; R92; C21; C81;
I had changed R66 and R87 from 100K to 47K
I had put 470 pF in parallel to R67 and R88
I had put 100 pF in parallel to R66 and R87

The audio sensibility of my falcon is now orrible not better of the
original state.

So, I'm looking for the original values, for re-replace it, of the
follow components:

R56 =?
R57 =?
R90 =?
R92 =?
C21 =?
C81 =?

THANK YOU!!!

Yes.

Will I be
> able to use Music progs. (as Cubase) with it (High res. mode)?

Most modern well-behaved programs are compatible with high end graphics
cards, but some aren't. I've seen some mono only programs insist on mono
even when running in hi rez color.

> How much should I should pay for it?

MegaSTE's seem to be going between $200 to $500.

Folks, what's the problem with a really simple config file like SMU's Start.set? You just have to ensure to use TABs to divide all tokens, but SMU warns you (instead of crashing) if you don't.

BTW: SMU '98 will be released quite soon (yes! it's really its second birthday already!) introducing a French translation.

bye, Thomas

Seems a neglible difference to me. You would need a schematic to know
what the max current draw for the circuit is, but even if it were 500mA,
20mA more is only 4% over, and most products are over engineered to
accomodate such a small margin. I would have no reservations about
putting it in my computer.

Preben Sloth wrote:

I have been trouble getting satisfactory printouts from my Atari lately due to the drum going bad on my SLM 804 laser printer. Since the drum is so expensive, I got a Cannon BJC 610 720x720 color printer, but have not been able to get this quality out of it due to lack of modern printer drivers.

I am new on the net, and am used to the old BBS days where you could just dial up and browse for support files. Where can I look for drivers for my new printer? Specifically need for:

Pagestream 2
NVDI 5
Imagecopy 4
Speedo GDOS 4
...for starters...

Alternatively, a cheap drum for an SLM 804 or SLM 605 would be appreciated.

Thanks,

-- John

3119. Re: MagiC and symbolic links

Newsgroup: comp.sys.atari.st
Date: 1998-02-13 00:00:00 UTC
From: dietmar.belloff@chiru.med.uni-giessen.de
Message-ID: <6c2u7e$10bc@c4.hrz.uni-giessen.de>
Source record: 107615

Hi Gordon,

>Does anyone know what symbolic links are and how to use them?
Symbolic links are 'alias copys' of a file, just like that ones used in MacOS.
An alias is not a physical but a 'ghost copy' of a file, telling the operating system tu use the original file instead without wasting hard disc space.

>I is not
>very clear in the manuel how to use them.
Suppose you have several configurations an they all use the same small utility. You can copy this utility to each of your configurations - that will waste too much disk space. You can use a symbolic link to this file and it saves you much trouble when updating this utility - you only update the original program an the links use the new version automatically (caution: the name must be the same!).

BTW: Thats exactly the way most Atari desktops handle their desktop icons. They don't put a physical copy on desk but they know where to look for the original;-)

Too abstract? I give you a short example.

I use this feature for filter programs I need in each configuration of CAT, the news&mailreader for german MausNet. Each configuration needs the same filter program with different commandlines, so the I put the program in folder F:\UTILITIES\ while I use a symbolic link in each configuration to point to the original.

If you use jinnee as desktop it's quite easy to make a symbolic link: just hold the ALTERNATE key while you drag a file...
If you use MacicDesk, it's almost the same.

>What is Drive U used for?
Opening drive U, you see a copy of all existing drives in your system. Most useful feature is the possibility to send characters to one of the peripheral devices like printer, midi, serial etc.
If you have your modem connected to modem1 just try starting MCMD.PRG (or TOS, i renamed it to get all the ins and outs in the console) (in C:\GEMSYS\GEMDESK\) and enter echo "ath1" >U:\dev\modem1 (just look at the exact device names)
This will hook off you modem. To reset just type echo "ath">u:\dev\modem1
(remark: this commands only work in non-german modems, because of BZT restrictions. My USR Sportster does it anyway...)

Got it?

Greetings from germany,

Dietmar

I considered this interpretation too, but apparently Magnus did not mean that,
as me mentioned a bad slowdown of execution of MagiC if ST-RAM is not cached.
So obviously he's after running MagiC in ST-RAM.

> The problem is not with the Falcon, Afterburner or MightySonic.

How can you tell ?

> For whatever reason, there is a compatibility issue with MagiC here.

Seems you do not know precisely what is causing the problems ? This situation
is far too complex to make any judgements without a full understanding what's
going on. Concerning your point above : I've never seen any document by Andreas
or ASH state that MagiC could be run from Fast-RAM. I don't know if MAGXBOOT
on the TT loads MagiC into ST-RAM by default. If so, then you're clearly using
MagiC outside it's specifications.

a) The Resolve action under STinG should time out after some time. This
should be in any case.

b) If Geneva had the $c9 GEM opcode implemented, like all Atari GEMs had,
then you should be able to conveniently kill those applications from
the Geneva task manager, without rebooting.

c) Until recently, the RESOLVE.STX and the UDP.STX had a bug that caused
the resolve to not react to ICMP unreachable messages, which are sent
when the connection to the name server is broken somewhere. This holds
especially if there is no modem connection. Get a new set of modules
from my web page (MODULES.LZH). With these, the resolve call returns
immediately if no connection is present.

> pressing the Escape key has any effect. If I type in an address that
> cannot be resolved I must wait until the resolve attempt times out,

The resolver only times out if there is no reply coming in from the name
server. I'd be a poor name server that never comes back to the client if
the name could not be resolved.

> I like Howard Chu's solution to the problem, spawn a small separate program
> ...
> another resolve, STiNG should be able to launch another copy of the resolve

That is not STinG's business. It's CAB.OVL's or even CAB's. You mentioned
Howard Chu above. He did not write MiNTnet, did he ? Which part did he
write instead ?

> multiple packet streams, and I know STiNG can as I ahve used telnet and ftp
> simultaneously). I don't know if this would work under singletasking
> though. Perhaps if the resolver were part of the package in the autofolder
> so it loaded at bootup and was present, ready to do its thing. This might

The resolver *IS* part of the STinG package, and *IS* loaded at bootup from
the AUTO folder, and *IS* present all the time while the computer is working.

When starting from the AUTO folder, STinG reports what it is doing. Watch it !

Actually an obvious difference is that all public server will allow logins
using the name "anonymous" and e-mail address, while your ISP won't allow
that. Most FTP clients come with the name preset to "anonymous", so maybe
Hallvard simply missed to put in his authentication information ?

This is not true for properly designed stacks. A broken link (like hung up
phone line) causes ICMP unreachable messages to be sent back, which will
cause the TCP implementations to reset the connection. Basically, it's lost
after that.

> Sometimes you can wake the connection up quicker after re-establishing
> the link by pinging the remote host just to let it know you're there.

Ping has no connection to TCP, so "just to let it know" doesn't work.

You're right, it cannot work. Zmodem needs the full line, and it can only
up/download between the two points it connects. It could be made cooperate
with PPP, if the ISP did that too (no way with SLIP), but even then only
up/downloads to and from your ISP are possible, nowhere else in the Internet.
Zmodem simply is incompatible with TCP/IP.

That's not Zmodem. Zmodem is specified to run on a serial link as a direct
connection, which Telnet never does.

Using the Telnet binary option, I believe a protocol similar to Zmodem could
be set up that then rides on top of the Telnet protocol. Maybe that is meant
on the PC. But even if it's called Zmodem, it isn't one.

For the Amiga thing, this is abusing a Telnet connection for simulating a
serial link. I doubt this will work with anything but two Amigas at both
ends of the Telnet connection.

> communication between two or more people, and what kind of communication
> will it be when each person "speaks his/her own language"? just a thought.

Yep. The whole point of networking is interoperability, and it's this
what is lost once people start imposing private "standard"s on the data
that goes across the networks. Improving the reader is fine, as it does
not affect the data, but "improving" the writer software such that the
way the data is posted does not conform to commonly accepted standards
anymore, is frankly inacceptable, as it's a first (small) step in dama-
ging the Internet.

Is that your's to judge ? Are you claiming you know all the implications ?
I guess you have never used mail in an environment where the line length
really matters.

> I would say that it's down to ASH to make their EMailer write with any line
> length showing on screen that they want, but to convert it to a maximum 80

That would be an acceptable compromise I suppose, but I guess people weren't
quite happy with it when they discover that even carefully crafted ASCII
tables are reformatted too such that they can't be read anymore.

Hi!

I'm about to buy myself an Atari Mega STe with 240 MB HD and 4 MB RAM.
The guy I'm buying it from says it has a graphics card. With this option
I can fit an PC VGA monitor on to the machine. Is this right? Will I be
able to use Music progs. (as Cubase) with it (High res. mode)?
How much should I should pay for it? (It've got a noisekiller(for the
HD-fan), a bad 124 monitor, 2 mouses, etc)

Thanks

>Does anyone know what symbolic links are and how to use them? I is not
>very clear in the manuel how to use them.

They're a sort of virtual copy of the original file or folder which behaves as if it's in the new location. You can rename the link and move it around just like a real file, but it's just a pointer and the real file itself is used.

You can create one by holding the ALT key down while dragging a file from one window to another in Magxdesk (as if you ware copying it). Symbolic links always have italic filenames so you can easily spot them. You can delete them just by dragging them to the trashcan (the real file isn't touched: just the alias is deleted).

Some things I use them for:

1 Rather than copy/move ST-Guide docs to my guides folder I just alias the .HYP and .REF files there. ST-Guide behaves as if the real files were there while the files are still in their original folders. Saves space on the partition where my guides folder is located.

2 For similar space reasons I generally only put aliases in my MagiC start folder as it's on a small partition.

3 I've put aliases of STinG's DIALER.APP and DIAL.INF in my CAB modules folder, so I can call the dialler from CAB's modules menu.

>What is Drive U used for?

You can set up a unix-type file system/directory structure there using symbolic links (similar to MiNT). All of your physical devices appear there as directories or files, so U:\C\AUTO is your AUTO folder, ie it's another way of referring to C:\AUTO.

MagiC itself creates virtual files and directories there for its own use, eg PROC containing "files" for each running process and DEV containing files representing hardware devices such as the midi ports and the screen (CON).

As an example of the kind of thing this is for:

If you use NVDI with its FPRN device, once you've installed the driver in MagiC's XTENSION folder you'll find a "file" called FPRN in DEV which it creates. If you're using a program which can print to an output file (such as NVDI itself), you can tell it to print to

U:\DEV\FPRN and the output will print via the FPRN fast print
routines.

This is absolutely true in my experience. But with z-modem I could hang up the phone, turn off my computer, wait a week, reconnect and just download the second half of the file, if I wanted. That's cool for those occasions where it is just taking too dang long to download the file becuase you have a stinky 14.4 connection and the guy supplying the file didn't stop to think to break it into chunks smaller than 4 megs, or whatever.

3140. Printing from CAB

Newsgroup: comp.sys.atari.st
Date: 1998-02-13 00:00:00 UTC
From: szhays@dilbert.ucdavis.edu
Message-ID: <6c0ecgfhr1@mark.ucdavis.edu>
Source record: 107659

This may have already been answered in here, but I must have missed it because I thought I didn't need the answer. You see, I know I used to be able to print from CAB and have the images print. But I just tried to print from CAB for the first time in, like, two years, and the images don't print now. I checked all the dialogs and every is set to print images. I checked the manual and it said printing images requires a special VDI call and if it doesn't work, just deselect the image feature. Well, big whoop, what that means is, if it doesn't work just give up.

What gets me is I have NVDI 3.02. If that doesn't support this particular VDI call that what to I need!? And I'm also frustrated because I know printing with images worked with this version of NVDI when cab was at 1.something, but now that I have 2.5 I have lost this feature!

>in all configurations (graphics modes)!

Brilliant. I just downloaded it and tested it with my 520ST and my 1040STe.
The videos of Miss Anderson and Mr Lee played on both machines in ST high
and ST LOW. In fact as I type this I am watching Miss Lee perform a series
of Acrobatic feats no mortal should miss. Thanks once again as I have proved
to my friends that my 13 year old computer can play these. This is truly
unbelievable.

>It can play a virtually unlimited number of MPEG videos independently in

Thanks for the information. I hope to have a Falcon soon too.
>
>> I know that the Atari players can only display certain frames,
>
>1stGuide can display *all* frames (I/P/B), so it's not a typical
>Atari player!;-)

Boast boast boast. It is true. On the ST the speed is not fast, about 3 frames per second and the clarity depends on how much you fiddle. I have only played with it for about 5 minutes so I know there is more it can do.

>> and maybe the creators of these files are
>> compressing them in a way that is incompatible for our players.
>
>No, it's rather vice versa: Usual Atari (proprietary) demands and
>developments are incompatible with reasonable standards developments.

Thanks for the input. It is a well reasoned argument but I don't know if others are following you clearly.
Regardless to all ATARI ST USERS you can VIEW the Pamela Anderson MPEGS which is a LOT better than NOT BEING ABLE TO VIEW them at all.
So far I have found HI RES to be the best, but again, I haven't put alot of effort into this program yet. Merely booted it and selected a file.
>
>Regards,
>Guido

Thanks for the program.
I will be posting the URL for the MPEGS listed in the header, this weekend and directions on how to locate them from the page. However this is only for research purposes;-).

Now so far 1ST Guide is the only player that I am aware of that allows you to view these files. IT works and it allows my SINGLE TOS 1.0 machine to view the clips and work at the same time. You may at first question the quality but the tools are there to get the picture acceptable. Certainly better than nothing at all:-). So if you emailed me for the MPEGS and you view them with 1ST GUIDE, I hope you follow my lead and support the author. It can only get better for us and there are alot of MPEGS out there.
Unlike Falcon/TT owners I don't think ST users are expecting 32fps and we should be happy at being able to view any 24bit video file.

Thanks Brian.

or third party: MegTT (upto 128MB), MightyMite(up to 64), AixiTT (up to
64) or so, to be equipped with ram.

C>What can you do with a TT that doesn't have TT RAM?
upgrade TT-Ram;-) or upgrade ST-Ram up to 10MB (than VME-Bus comes to stop
it growing;-)) but it's a more complicated way to get more ram...

C>What more can you do with a TT that DOES have TT RAM?
...scan big truecolor pics....run more applikations at the same
time....create bigger RamDisks....impress 1040-owners;-)...load bigger
files or more of them...run programms faster out of it...

C>How do you change the clock battery?
...any problems?

C>What monitors work best on a TT?
ECL 1280*960 monitors;-) TTM194, TTM195, ProScreen, Eizo6500....
or use a VME-graficcard and run any good SVGA-monitor if you want or need
color...leave out the original ATARI colormodes, they will cause headache
and nightblindness;-) while running on 60Hz...

This is not strange at all. The Quantum Fireball is only recognized by
hard disk drivers supporting initiator identification. So you simply
have to ensure that this feature is enabled in the driver you use.
HDDRIVER supports this, refer to the manual.
Note that TT and Falcon can't boot from the Quantum Fireball.

They stopped producing the package long time ago, but you have a good chance to obtain one maybe in one of the german newsgroups.

Try posting in maus.suche, maybe there will be an answer.

> but does nothing with
>it and the arithmetic procedures are dummies.
oops, then you must have a very early version.

You can try Megamax Modula-2 instead, its now freeware and you can find it at the authors homepage: http://www.muc.de/~tt/main-e.html#DEV

Unfortunately, the software documentation is entirely german...

My TT boot's from a Quantum 1280S (replaced the ST157N harddisk) with no problems.

While reading your statement here, in subject like news articles and with reference to your excellent articles in a german magazine, I am getting the wrong impression that all Fireballs requires the initiator identification.

BTW, my TT has TOS 3.01, and the Fireball is a (from Linux dmesg):

Vendor: QUANTUM Model: FIREBALL1280S Rev: 630C
Type: Direct-Access ANSI SCSI revision: 02

Source record: 107675

Hi everyone,

As I started this thread I'd like to thank everyone for all their comments and would also like to apologise for any confusion I may have caused by saying that Stoop didn't work at all with Magic or even that I wanted it to work with Magic. I'm quite happy to select my desired setup at switch-on and then have the boot program ignored after that - so the autoexec.bat solution is perfect for me.

If people are looking for a boot manager that works well with and without Magic my research found that McBoot by John Mcloud is a good choice. A demo is available from:

ftp.cs.tu-berlin.de

in directory:

/pub/atari/Utils/Disk/mc_bo103.lzh

paxton@zetnet.co.uk (Tony Greenwood) writes:
> This will show the correct colour on colour browsers, But add a
> background picture in CAB med or high rez on a ST and it becomes
> transparent,

Yes, but this happens only in resolutions with less than 16 color
(mono, med rez). The reason is simply that there are not enough
colors (or no colors at all) available. If I tell TOS to fill the
table cell with green (in mono rez), it fills it black. If I tell TOS
to display the text in this cell in red, it displays the text in
black (all colors other than white are displayed in black). So
black text on black background is nothing I would call 'readable'.
This is why CAB ignores most color settings in mono resolutions.
And the two additional colors in med rez are no real help to
improve the output. And background images should be switched
of in these resolutions because in most cases these will
only make the text unreadable.

BTW: Have you ever seen Netscape Navigator/Communicator in mono
resolutions? I can see it here in the university (version for Unix/X11).
I can tell you, that NN and NC will produce many pages totally white or
totally black, without any chance to read the text. The reason is,
that NN or NC never ignores the colors, even if it's certain, that
the result will be unreadable. An there's no option (like in CAB)
to tell NN/NC to igore all the color settings of the page.

So the best settings in CAB for mono resolutions (and med rez) are:
- Don't use the color settings of the web pages
- No background images

Hey! aclauss@rbg.informatik.tu-darmstadt.de (Alexander Clauss) wasn't
it 13 Feb 1998 12:29:38 GMT that you wrote:

>> This will show the correct colour on colour browsers, But add a
>> background picture in CAB med or high rez on a ST and it becomes
>> transparent,
>
>Yes, but this happens only in resolutions with less than 16 color

Wrong!, I tried it on my ATARI ST in 320x200x16 and it happens there
as well, I think you will find that tables and background do now work
correctly on an ATARI ST, 2,4 or 16 colours...I thought you would know
this ;-)

OK there are reasons, I understand the problems with colours, That
was NOT why I posted,

I am not using CAB to surf, I am making a web page for ATARI users to
visit using CAB, I cannot force them to turn background off and page
settings off can I!, I take the creation of ATARI web pages seriously
and thats why I purchased CAB for testing:)

BTW The CAB Manual..Page 22 Tables and page 32 Display/colours make
no mention of this problem, thus I can't assume the people surfing in
mono or med rez have turned this off, My suggestion would be to add
this to the manual as it is quite obvious all the options are not
ATARI ST compatible, this should be pointed out shouldn't it? :)

>improve the output. And background images should be switched
>of in these resolutions because in most cases these will
>only make the text unreadable.

OK now we have gone all around the houses and finally agree that CAB
does have a problem with tables being transparent (just like I said
) can we agree that as a web page author there is no way of making
sure every CAB user with a normal ATARI ST has them turned off?

heres is my solution..

The above ensures people with java capable browsers such as Netscape
and MIE get a background, but non-Java (Like an ATARI ST) will not get
the background picture but a background colour,

I tested the above on CAB 2.5d and MIE4 ,Netscape 4, it would seem to
do the trick,

Hopefully the above is some help to ATARI Web page makers who want to attract mere mortals that own ATARI ST's to there site :)

Many thanks for the detailed response Alexander, But I wasn't complaining, just looking for an answer,

Please don't mix Java and JavaScript, what these two have in common is not
much more than the first four letters.

But the above example is one of the few uses of JavaScript I could live
with, as they don't break browsers without it and don't cause any
"gimmick" effects like scrolling text in the status bar, etc. (the reason
why I disabled JavaScript in Netscape Navigator.

3166. THE ATARI ST QUICK FAQ - v2.3

Newsgroup: comp.sys.atari.st
Date: 1998-02-13 00:00:00 UTC
From: bales@hol.DELETE.THIS.fr
Message-ID: <6c1snp$8dh$2@news.stortek.com>
Source record: 107685
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

THE ATARI ST QUICK FAQ - v2.3 / 1998-01-29

The 'Quick' FAQ was initially intended to be a small list of resources made to avoid comp.sys.atari.st newcomers asking the same questions over and over again. However, as the project progressed, and other members of the Atari community became involved, it simply became bigger and bigger. I doubt it really deserves to be called 'quick' any more, but hopefully it will still serve it's original purpose.

Here is where you can find it:

HTML/WEB - FRANCE http://wwwperso.hol.fr/~nbales/quickfaq.htm
HTML/WEB - USA http://www.geocities.com/MotorCity/2090/quickfaq.htm

TEXT/FTP - NORWAY ftp://ftp.sol.no/user/hallvart/atari/info/quickfaq.txt

ZIPFILE - USA http://www.geocities.com/MotorCity/2090/quickfaq.zip

If you cannot access any of these, but wish to receive a copy of the FAQ through e-mail, send a message to the following autoresponding address:

AUTORESPONDER bales@garonne.stortek.com
Note: The subject line must be: ATARI FAQ REQUEST

Cheers,

Nick.

>by 520ST, that would be fine.

You definitely don't want an old single sided drive. Get a PC 1.44 mechanism
and put it in the SF354 case, it should work perfectly well as a 720K drive.
Just follow the instructions on how to do it. You can find them in the Quick
FAQ. These instrctions are for changing an internal floppy drive but they
should be applicable to an external one.

Cheers,

Nick.

This is a bug in Stzip. Nothing harmful, just visually annoying.

>Or another example: I just tried out a program that converts currency amounts

Yes.

>Is this a common occurance in Med Res?

Not with more modern programs but it does crop up in older ones.

>Is the
>reason for the problem I'm noticing because these programs were meant to be
>displayed in Hi Res?

Probably.

>Or am I getting more confused in my old age than I
>thought?

Nope! Put simply, programs which make use of the part of the operating
system known as the "aes" do not have to worry about what screen
resolution is being used. The aes takes care of most of the conversion
details. If the program draws its own graphics (including fancy text)
then it has to do these conversions itself, or run the risk of being

"stuck" in one particular resolution.

>Sorry, for the long winded post but not sure how to explain it clearly (and I
>probably haven't).
>
>Any help/info anyone could provide would be appreciated.

It is almost always possible to find more modern replacements. In
those rare cases where this isn't possible you can sometimes fiddle a
bit to persuade something to work. Zcontrol for instance comes up with
the bottom half of its window off the bottom of the screen. The cure
for this is to run a mono emulator then reduce the number of cpx slots
it displays to it only takes half the height of the screen. Save the
info and quit the mono emulator. Next time zcontrol runs you can get
at everything.

You want it to. They are designed to spin constantly. Stopping and
starting them just reduces their life.

>I am using ICD software/hardware.
>Any ideas or is my memory of the quiet hard drive incorrect?
>All hints ideas welcome.

Assuming the hd is not liable to be knocked about in your absence,
leave it running if you expect to use the machine again the same day
(some people leave the hd running constantly for *years* - I kid you
not!). By all means turn the computer and monitor off but leave the hd
running - it'll last longer.

>
>How can you tell ?

What I mean, and excuse me if I repeat myself, is that fast ram on
those two units begins at the same location as on the TT, which I
assume to be the "standard" way to allocate fast ram.
As most software recognizes this method, and the ones that do not
usually don't work from "real" TT fast ram, I assume (make an ass out
of U and me:) the problem lies with MagiC. Running BSS Debug, I can
find the start and end of MagiC in fast ram. It does indeed load low,
just behind the disk driver (if I remember correctly. It's been a
while since I really looked at the problem). I used BSS Debug for
poking around to see what was going on.
MagiC was adapted for use on the Falcon. Not many that long ago
expected fast ram to be present. The TT sets up fast ram by hardware,
and maybe that is where the problem lies. MagiC just dosen't expect to
have to "watch out" for fast ram setup by Maddalt.
All IMHO.

I managed to create one for my internet software which it works very
well.I did find out that I had to copy all the files to the programs I
use,using the ALT key as I kept getting an error say that the RSC file
is not found.Pretty handy as I can keep all my most used programs in
one window.

How would I use the devices in Drive U? Do I just drop an icon onto the device I want to use like the modem device for example,does the file then gets sent to the modem and so on?

Thanks again

Nima Montaser wrote:

> I still don't know whether HDDriver supports Cubase Audio?

Yes, it does. Actually there is nothing an AHDI compliant driver like
AHDI has to support in order to run Cubase Audio with it. Atari made the
specificiation, i. e. the AHDI release notes. If a program (in this case
Cubase) works according to this standard when calling the hard disk
driver it works with any driver that fulfills this standard.
I think there is no current driver that doesn't adhere to the AHDI
specification.

3180. CAB MiNTnet OVL 1.8404

Newsgroup: comp.sys.atari.st
Date: 1998-02-14 00:00:00 UTC
From: hyc@frisky.la.platsol.com
Message-ID: <6c3m6q$nns@frisky.la.platsol.com>
Source record: 107499

Howdy. This is just a couple of bugfixes, nothing major. Found another bug in my redirect handler. Found a minor bug that was causing pages to reload unnecessarily instead of using the cache. Found a bug in the request handler that prevented mailto forms from working. Found a bug in the SSL support that prevented connections to broken SSL servers. The source & binary are on http://highlandsun.com/hyc/, as usual.

Note - if you tried this OVL before and it always crashed, and you are running on Nemesis or Afterburner or similar accelerator, try it again, but turn off the Fast RAM flags on the CAB.OVL binary first. Running from Fast RAM appears to be a major problem with these accelerators. I'm not sure why, but turning off those flags makes everything work smoothly. I don't have the hardware available to track down the problem myself.

If you have been using the SSL-enabled version of this OVL, and had trouble connecting to some servers, that problem should be fixed in this version. (Also as usual, I do not provide the SSL-enabled binary myself, you will have to get it from someone else.)

Note - if you did not install any authentication certificates in your /usr/local/ssl/certs directory before, then your connections have not been authenticated. This means the SSL code was unable to verify the identity of the remote server you connected to. This means it was possible for an impostor to pretend to be the server you wanted to connect to, and steal any info that you sent. If you don't have these certificates, you can get them out of the SSLeay source distribution. See
http://psych.psy.uq.oz.au/~ftp/Crypto/
for more info on SSLeay and how to get the source code. Make sure you do this *before* you start using security-sensitive web servers. You're taking a pointless risk, otherwise.

Needless to say, I offer no warranties with respect to the usability of this code for any purpose whatsoever. If it fails to perform to your satisfaction, you're welcome to sue me for as much money as you paid me. I.e., zero.

: Please let me know how the Syjet performs - how fast it is (with HOWFAST),
: if it can replay 8 tracks simultaneously, if it can make a timestretch
: correctly etc...

: >Is there a later version of Diamond edge 2.04, or another prg
: >that can sucessfully handle this drive?

: Diamond Edge can't handle larger partitions than 512MB since the maximum
: sector size that can be handled by DE is 8kB...
: Try using the old, but very well working CHKDSK3 from Atari (should be
: available just about anywhere since it's Public Domain).
: Another way (that uses a lot of HD space) is to simply copy the files to
: another partition - then the files are automatically optimised...

: Best regards,
: Claes
: claes.holmerup@mailbox.swipnet.se
: http://come.to/claes.holmerup

Thanxs Claes,
pehaps I'll partition it into 3, or try to get the full version of zorg
2.08, also I'll try and get CHKDSK3 and try that.
The Syjet seems to record and play back fine, 8 tracks doesn't seem to be
a problem at all, I haven't tested it further than that. This test was
done when the disk was relatively empty, I had a JAZ drive prior to the
syjet but had lots of problems with that, replaced under warranty twice,
plus a whole series of cartridges that couldn't be formatted or
partitioned, so I gave up and bought the syjet thinking it couldn't be any
worse.
I don't have HOWFAST, but I ran icd's rate hd from 6.5.5, and it comes up
with access time 16ms and 1369ks.
I have'nt had occasion to do a time stretch as yet, but in the past
Cubases's timestetch function has proved inacurate regardless of the
drive.
By the way I've been using a micropolis 1.7gig av lt for a few years now
and it's absolutely rock solid.
Regards Brian.

: Hi Brian,

: I've been wondering about the Syjet drive myself. How well does it
: work for audio recording? How many tracks at once, etc.? (Aside from
: the problem you mentioned). I would suggest you take a look at a
: shareware disk defragmenter/optimizer/fixer-upper called ZORG. It's on
: most of the ftp sites - the latest version I've seen is 2.08. It's

: claytone@aa.net
: Clayton Murray
: Seattle, WA USA

Hi Clayton,
Thanx,
I downloaded v2.07 of zorg, it was only a demo version, so I can't tell
if the the defrag works well as it was disabled. Do you know if it works
on partitions over 512k?-- Is there a graphical representation of the
process? If you use it, is it reliable? If so I'll try and get it
registered.
The Syjet seems to perform well, I've tested playing back 8 tracks or 4
stereo tracks, it seems to do that effortlessly. This test was done when
the drive was relatively empty, I say this because my ex JAZ got very slow
after there was a lot of data on it, then I'd get hd too slow messages
(before it died for the second time)
Regards Brian.

I've reconnected successfully during news downloads with NEWSwatch.
Haven't had to do this for a while, though, so it could have been with
STiK rather than STinG. Back when I used to use NOS dropped lines were
no problem if you redialled as everything just picked up where it left
off. Presumably STinG doesn't do this (and isn't meant to)?

Is this related to the stuff going on in the other thread about
reboots/reconnections where it's emerged that Demon in the UK is odd
(though convenient) in this respect?

>> Sometimes you can wake the connection up quicker after re-establishing
>> the link by pinging the remote host just to let it know you're there.

>Ping has no connection to TCP, so "just to let it know" doesn't work.

This was a subjective impression. As you can doubtless tell, my
knowledge of this stuff is minimal. Presumably the point at which I've
got bored and pinged the remote machine roughly coincides with the
packets finally arriving after a reconnection (attention
timeout=reconnection delay <grin>).

Thanks for the clarification,

TTFN

Hadn't thought of doing this, so I've just tried. No it doesn't work as (presumably) the files in DEV aren't regarded as executables (ie programs). Magxdesk thinks you're just trying to copy the file there and complains that the disk is write protected. Looks like you have to use redirection to send data to the devices. See Dietmar's example for how to do this from the CLI, or use a program's "Print to file" option if available (as in my original NVDI example or when using Papyrus' internal printer drivers).

> this ;-)

Then, you must have switched off the option which tells CAB to use
the document setting (CAB 2.x). But I must say that I was wrong too ;-)
At least CAB 2.5 and later does NOT(!) ignore the color settings
of the HTML page even in mono resolutions! But it does not use
the colors as they are defined in the HTML code, instead it tries
to find the best matching of white and black so that the text remains
readable.

In CAB 1.5 this was different. Sorry for the confusion, but usually
I use CAB in 256 color mode so I was not sure what the different
versions CAB are doing exactly (this was implemented long time ago).
But now I've checked what CAB >=2.5 is doing in mono, and it definitely
does NOT display transparent tables, if a background color is defined
and if you've not switched off the option "use document setting.

Freedom and Selectric are no problem, but UIS is - probably due to its age or
summat. There is a way though, because I managed it, thanks to the advice of
Mark Baines.

You need to start it with:

#_AUT C:\UIS_III.PRG

.which only works if you are running MagxDesk and not an alternative desktop.

Just use qed. Drag & Drop a file while pressing the Shift key to a qed
window - qed will insert the complete path and filename. Itï¿½s really
easy to configure the START.SET with this convenient method.

Hi!

In article <34e49595.17502699@news.zetnet.co.uk>,
paxton@zetnet.co.uk (Tony Greenwood) writes:
> Yes I do know the difference, I wrote the above didn't I?,
> You are being a bit picky don't you think ? :)

Call it picky, if you like. But as a Java capable browser (which you
said was necessary to get the background) not necessarily suports
JavaScript, I had to point out the difference.

And besides, I didn't imply that you don't know the difference. But some
people reading here might not.

Ciao

>Anyone have any instructions on how I can get my IOMega Zip drive to work with my Mega ST2 with TOS 1.4?

Easy..... Set the ID switch on the back of the Zip drive. You only have two selections ID 5 or 6. Make sure that no other SCSI device you have are set to this ID number. Usally this is not a problem. Connect you ZIP into the SCSI bus. IE. the hostadaptor. If this is the last unit on the SCSI chain mack sure that you have the terminator on it and removed from all the other SCSI devices in the middle of the chain. And it should be ready to go once it is formatted and all. I am assuming that you are using ICD host adaptor and their utilities and or HD Driver? if you are using ICD software 6.xx or better just boot the ICDFMT.pgm file . It will scan the SCSI bus and will give you a selection of what is on the bus. Click on the ZIP drive. and follow the prompts. Don't forget after you format the zip with the utility that you also need to partition the ZIP. At this poing you will have to make the decision to divide the drive into smaller partitions to remain compatable with Atari format or use the whole ZIP as a BGM partition. I use mine as a BGM. Hope that this helps you out. If you have anymore quiestions you can e-mail them to me here on AOL or at dwmoar@teleport.com.

well, give me a speeder for TT that makes it run 4 times faster and I buy the Ram....it's quite funny they can break the 10+128-Limit, but with a modern and professional size of RAM you need a machine that can handle it before you go asleep. Don't missunderstand: I love my TT but it's not a profmachine in grafics any more, the only reason I can think of when I discuss about RAM more than 32MB or even 16MB on Atari. Maybe it makes sence if you get STARTRECK installed...?

HARDWARE

1.ST 1040F 1MB ram. This machine has an audio output jack (RCA female) so you
can plug in to your external amplifier. Listen to the robot voice or your games loud!! No need for a pre-amp. It will go with hayes modem/cable and the famous BETTLE mouse!. $55

2. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari or pc. $25.
(has original PC software)

3.Atari PS for external Disk Drive $5

4.external PS for the 520ST $5.00

5. SC 1224 color monitor. It needs video cable $16 (I can give you one that needs
a connector at the other end (free).

SOFTWARE:

1. TRUEPAINT V 1.02 $15 Excellent drawing program; all resolutions and colors. Works in ALL
ataris. From B\W. to true color. Manual available.

2. ICD hard disk utilities Version: 6.2.3 2 disks no manual $10. I will send a list of the files upon request.

3. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations audio-video; Also watch
kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol CD-ROM $15 (Falcon).
Needs Multitos.

Free stuff (No need to buy any of the above only pay shipping!!:) :

Free manuals:
HD Driver 4 rev 1.1 1/96
Deskjet utilities pack v 1.2
Calendar and appointments
Atari falcon AFM; D2D; SAM.
Imagecopy 2
Pagestream 2 quick start manual

- Omnires Monitor emulator for the ST.
-External floppy drive 1DD good case/mechanism.

If interested send ZIP code to ask UPS for charges.. For software I can send it for $3.00 US. (If you are in the US; I am willing to send abroad also). Phil.

Hi Frank,

see you're using a 1208 as well... are u still using the original Matrix drivers or have you upgraded to the NVDI-for-Matrix just like me?

I found all Matrix drivers created problems with certain software (like Freedom, That's Write, ST-Guide and some more...).

I got NVDI 4.12 for Matrix directly from Behne and it works 100% with all software that previously didn't run OK. Not to mention the speed increase...

Just curious about your experience... :-)

Hi Dave,

yup, got the same experience. Also Selectric won't work (at least, I did not
get it running together with MagiC).
Boxkite will and Freedom will.
I got hooked to Freedom in the meantime and can recommend it highly.

Hi,

normally you'd not expect a PSU to give up on an additional 20 mA current drain... however, my experience is that ATARI PSU's have been designed with no margins at all.. So don't pick on me when one or more capacitors blow up when you connect the new drive :-)

That's my 3 cents...

3210. Re: problem w/ HD DRiver/ICD w/ Quantum Fireball 2.1 and TT

Newsgroup: comp.sys.atari.st
Date: 1998-02-14 00:00:00 UTC
From: Claes Holmerup <claes.holmerup@mailbox.swipnet.se>
Message-ID: <887419879.494672@nn1>
Source record: 107630

Hi Nima,

> I was wondering if anybody has ever come across this problem.
>I have been trying to install a brand new Quantum Fireball SCSI
>2.1G on a friends TT TOS 3.1, but I have had no luck:
>He BTW wants to use it for Cubase Audio D2D recording.

Check out my homepage http://come.to/claes.holmerup and you'll find Cubase Audio compatible hard disks - among much other useful information...
Since the Quantum Fireball drives can't be used for recording with Cubase Audio for the Falcon, I doubt that a Yamaha CBX-unit (which is required to be able to use Cubase Audio on a TT) will work any better. If I remember correctly, you can't even use larger than 256MB partitions on the CBX - and I believe nothing but AHDI is accepted as driver - correct me if I'm wrong, because this is information I've heard from someone who's less experienced than myself and I haven't had the opportunity to try it first hand (only by trying to help him on the phone). I believe it worked a little better when he used a HD cache program. The CBX version of Cubase Audio was discontinued long before the Falcon version, so it's less developed and may have problems that are quite different from the Falcon version...
The Fireball SCSI-disks can be used for playback of audio files on the Falcon, but not for recording - don't ask me why, but it just won't work
Many other HD's which use bus-arbitration work perfectly, however.

>I have used ICDPRO v6.5.5, HD Driver 6.1?, ATARI driver (ARGHHH!).
>Here is what happens:
>
>Upon starting the system, HD driver doesn't even see it. Its ID selector
>doesn't even see it. Very strange.
>
>ATARI's driver fails to see it too.

Since the HD uses bus-arbitration, you can't boot from it - you have to boot from another HD or from the diskdrive... Also make sure that the driver software can handle bus arbitration / initiator identification (AHDI can't, so you will probably never get the CBX-unit to work with this HD).

>However, ICD's driver and ID selector sees it with no problems. ICD can
>format and partition without any problems and I can install the driver
>on it.
>However, ICD is not compatible with Cubase Audio.

I believe later versions are, but they're not AHDI-compatible, which may cause problems in some cases - I'd stick to HDDriver, or if absolutely necessary AHDI. Since the CBX-version works differently from the Falcon version, I suspect that ICD won't work at all :(

>As a final questions, does anybody know what driver can be used
>for running cubase Audio on such a drive? What is the max partition
>limit?

As I mentioned above, I seem to recall that 256MB/partition is the maximum with the CBX and that it requires AHDI. The reason it can't use larger partitions is that the CBX and NOT the computer records the audio.
Doesn't everything make sense to you? Don't hesitate to ask me more...

Hi Brian,

>I use a Falcon running hd driver v7.00 and a syjet 1.5 gig removable drive
>for hd recording. The Syjet is partioned into 2 x 715 meg partitions.

Do you use Cubase Audio?
Please let me know how the Syjet performs - how fast it is (with HOWFAST),
if it can replay 8 tracks simultaneously, if it can make a timestretch
correctly etc...
I'd like to be able to add the Syjet to my list of Cubase Audio compatible
HD's on http://come.to/claes.holmerup

>Is there a later version of Diamond edge 2.04, or another prg
>that can sucessfully handle this drive?
> Any ideas would be greatly appreciated, it seems impossible to use a hard
>drive for professional audio if I can't defrag it.

Diamond Edge can't handle larger partitions than 512MB since the maximum
sector size that can be handled by DE is 8kB...
Try using the old, but very well working CHKDSK3 from Atari (should be
available just about anywhere since it's Public Domain).
Another way (that uses a lot of HD space) is to simply copy the files to
another partition - then the files are automatically optimised...

Best regards,
Claes

>shells?, more diskzines use STOS shells than any other,

Ah. Double edged point! Diskzines have a lot of the qualities of
games. Graphics, sound, animation. Also, all those cuddly fonts which
were nigh on impossible to do prior to GDOS, but which STOS could do
very easily.

>Even ST Format
>said STOS would be the best language to use to make a Multimedia
>authoring package...so I did :)

If something's worth saying then its worth saying oodles of times 'cos
how else is someone going to notice? ;-)

>>of any language that is subject to the same restrictions. What STOS
>
> No restrictions here mate? :)

Bet you can't write threaded code ... hmm ... bugger, neither can I
until the MagiC docs arrive in English. Now you set me off repeating
myself!!!

>>> DICLAIMER My above posting is a JOKE in response to insinuations that
>>>I like STOS.....get happy:)
>>
>>I am. Got 2 cases of Kronenbourg in the fridge! ... <G>
>

>I still reeled you in though :))))

I should have bought bigger bottles instead of those little ones:

```
WHILE (MORE BOTTLES)
TRUDGE DOWNSTAIRS TO FRIDGE
OBTAIN & OPEN NEXT BOTTLE
TAKE ONE MOUTHFUL
TRUDGE UPSTAIRS TO 'PUTER
TAKE ONE MOUTHFUL
CURSE AT EMPTY BOTTLE
ENDWHILE
```

There are a couple of variations of the above algorithm of course. The "take up half a dozen" at a time variation suffers from "warm beer" syndrome, the intermittent "sh*t, I left the bottle opener downstairs" syndrome, and the too frequent "agh, where's that bottle top legged it to now" syndrome - which is closely followed by the "gawd, I can't relax until I've checked it is not inside one of the printers again" syndrome.

The algorithm for pouring into a pint glass is a non starter. The animals are just too clumsy!

Am I a wee bit off topic do you think? ;-))

I just had a look myself at the homepage and messe.htm. Out of
curiosity I wondered if the package they'd used had done the same
thing microsoft publisher did to most of my site - it has a habit of
merging text and graphics into one huge image for no apparent reason.
Actually, there is a reason: if two things overlap they get converted
into an image. This new image in turn may then overlap something else
and so on. Trouble is, it's idea of what overlaps and our idea of what
overlaps just ain't the same. It has a good paper-plane making wizard
though ;-) I digress!

It turns out they were done with Netscape Communicator 4.01. This is
one of the "better" editors. After a quick check I discover it is nigh
on impossible *not* to notice this problem, and it is easily fixed.

If someone wants to email them, tell them this ...

Right click on the background image - then "Page Properties-> Page
Colors-> Use custom colors-> Background" and change the bugger from
white to black.

This will ensure if the background image is not loaded the white text
will still be visible. Some redesign is still needed however because
16 colour browsing with that background image enabled is a 'no-no'.

If you want to embarrass them then tell them it's next to the option
for specifying the background image (where it sez words to the effect
of "if background image isn't displayed this will be the background
colour")!! ;-)

Hello people,

I've been using my trusty old Atari ST for about 8 years now, and the other day it finally blew up. I was running Quartet when it just ceased to work -- like the power had been cut off.

I'm pretty sure it's the power supply that's dead, but I have no idea where I can get another one here in the UK.

This *would* happen just as I was going to start making serious MIDI music stuff with it. I use my 3DFX P200 for games :) and everything else...

I hope someone can help.

Please reply to me directly, as well as the newsgroup.

Thanks,

Douglas Cowan

This has happened to most of us, I believe, more than once. However, I tried building a power supply cable that would use the PC motherboard connectors, and it works. Someone had posted the plans for doing this, which is what I used. Unfortunately, I can't find the plans at the moment, but will be looking around a bit. It's quite easy to make them, as these connectors are easily found at most computer stores.

First of all, check the fuse. That can be one thing that blows before the rest of the circuitry, and they're mighty cheap. So's a power supply from one of those cases, whether it be a desktop size or bigger. A 165 watt supply will do as well as a 250+ watt supply, with the added bonus of also being able to run your hard drives if you have any.

I've got a 165 watt supply that's been left on for 7 years, with a few times of being turned off for maintenance and that kind of thing.

There was someone who was going to post the schematics for the power supplies that the STs use, but I've not seen that yet. It would be nice to have that kind of thing lying around.

: > program and have it run too (after all, TCP/IP should be able to carry
:
: That is not STinG's business. It's CAB.OVL's or even CAB's. You mentioned
: Howard Chu above. He did not write MiNTnet, did he ? Which part did he
: write instead ?

Er, Howard wrote the CAB.OVL. But my thought was, the CAB.OVL then has to pass that resolve request on through STiNG, no? And I thought if STiNG did this fabulously nifty trick, rather than depending on the author of the CAB.OVL to do it, then other programs that used STiNG could benefit as well. Programs such as A-FTP (which also stalls during the resolve), and TelStar (which _also_ stalls during the resolve). Who wrote TelStar? I don't think it was Howard Chu, or Dan Ackerman. Ah, it must have been Boris Cahan ;-)

: > though. Perhaps if the resolver were part of the package in the autofolder
: > so it loaded at bootup and was present, ready to do its thing. This might
:
: The resolver *IS* part of the STinG package, and *IS* loaded at bootup from
: the AUTO folder, and *IS* present all the time while the computer is working.
:
: When starting from the AUTO folder, STinG reports what it is doing. Watch it !

Yes. I wasn't as clear as I could have been. I meant this nifty new resolve would probably _also_ load from the autofolder, thereby being present in memory even on a singletasking computer, ready to do its resolving business behind the scenes while the GEM application (CAB or what have you) would then be free to read mouse actions and such so as to keep all the window gadgets functioning.

Anyway, just a thought. Probably the new version of the STiNG software that you mentioned in your latest post to this thread will go far to clearing up the annoying little problems I've been experiencing. But ultimately, it would be nice if the user always felt in control of the computer and didn't ever have to wait twiddling digits while the computer ignored the users requests so as to accomplish something like resolving a host.

-> I can get another one here in the UK.

Best Electronics has that power supply and just about every other part
anyone could need for their Atari computer. They're located in the U.S.
but service international orders. Their address and phone number is
listed below.

An internal ST 220 volt power supply is listed for $59.00 U.S. and their
part number is CB102621 and an internal 110 volt ST power supply is
listed for $75.00 U.S. with the part number CB101500.

The address is:

Best Electronics
2021 The Alameda, Suite 290
San Jose, CA - 95126 U.S.A.
(408) 243-6950

If you must call you should do it during the afternoon hours Pacific
Standard Time Monday thru Friday and ask for Brad.

All international orders they like to be prepaid.

Later,
James

Howdy to you to Charles.

>I know it was a bit off topic. I respect your comments very much.

Yes,- we were off topic, but I do respect your opinion. It was just my
2 cents of comments, I did not mean to citicise.

>I just don't like being blindsided by jerks setting up such Web sites to surprise
>Surf'ers.

You are right about that one, I do not like this kind of web sites either.
And I don`t think many other danes do.

>This gun stuff goes back for many generations, all the way to the Revolutionary War. >Thus protected by the U.S.Constitution. Yes, it's a blessing and a curse.
- snip -
>I would never injure anyone with a firearm except for life saving self-protection. >This is true of most Americans.
>It's just the stupid/ignorant/criminal you here about.

I know the history of your country, Charles, and I never ecpected you to any harm to another human. It is because of these stupid/ignorant/criminals you need gun control.
I can`t see anything wrong in owning a gun as long as there is a kind of control, who owns what kind of gun, what is he/she using it for.
We have gun control i my country, but still have some killing people, some by accident others on porpose.

>Porno was never accepted. I was brought up to protect a women's right to be
>free from exploitation.

So was I, and I protect any women`s right to say "NO".

>Different strokes for different folks. Freedom of expression is also protected.

Yes, - freedom of expression, if you accept the responsibility for the action.

> Thus the conflict of ideas.

It does not have to be a conflict, just different opinions. :-))

>I just don't want the future to be some version of the "BladeRunner" Movie.

I like that muvie, but not the future of life it shows.

>The World Wide Web is here to stay, as guns are.

> Do you want Web-control?

No, I don`t want Web-control. On the other hand, I did aprove that my IP has some control. No child porn. If the IP find someone with this kind of stuff, he/she will be reported to the police and procecuted. And the account will be closed.

>Maybe your right, nothing to get excited about.
>All off topic, I'm sure ;)

I may have missed something here? WHat don't you have.
PPP connection and a Graphical Web browser, or something else that I missed
in this thread? If its files for the internet, just reply and you will
get a list of what is required. And then you will get help on setting it up
after reading the manuals. Its pretty easy now, unless you live in sunny
hawaii and like to play music;-). But I have found that either you manage
to get connected and muddle through or unfortuneately you don't. However from
what I have observed in the recent recent past is that more are coming onboard
faster and easier than are falling overboard. Definitely it is sink or swim:-).

For all intensive purposes this is 100% true. I would just like to point out
that some 9 years ago I ran the SLM804 of a 512k ST. I used any text editor,
wordwriter and wordperfect. I could also print screen graphics with the
Alt-help feature. I am sure I did even more, but I can't remember. Just
a thought from the past.

Well it sure as shit does to me as I am pretty pissed right now anyways.
Check out this NEWSGROUP that is for COMPUTER DISCUSSION. I had 12 F*******
PORNO spams in a row. Plus a few more scattered about. I HATE IT. I WANT
TO READ ABOUT COMPUTER STUFF TOO. Now figure if he wishes to write in this
newsgroup, goes to deja news and BINGO , more porno is infringing on his
rights.

To me it is not just porno, but anything SPAM and commercially related
really really ticks me off. As it is I have yet to go to any of these spam
blasts, I go where I choose. I just hate always seeing the same trash.

You get the non atari computer oriented stuff off this NG and I will agree
with your forementioned comments.

Not a saint, just an Atari User.

Brian.

Anyone know why my Nova card might not display anything when I have the jumpers set to the TT position? I can only get it to work in the MSTe position, or with the jumper totally removed. Using either of these two options, I can't get more than 256 colors. Moving the jumper to the TT position just gives me a black screen. Are the drivers jumper position specific, and I just don't have any available for the TT position?

See even in countries that have gun control, it doesn't work! You will always have people that will use guns the wrong way. We in the US have enough goverment trying to control our lives, we really don't need gun control, we need to have
better education and respect for one another. This would go along way in solving our many social problems.

Brain,
I agree this is totally screwed. Maybe the ISP could control this type of message. Just a thought. Though I do not like the though of NET- control something should be done. The problem is that the internet spans many different countries all with different beliefs. What maybe acceptable to one society is not in another. Personally I do find this very offensive, but at the same time I do want to protect the rights of others. Somewhere the line must be drawen. But where and how can it be done to portect those rights. Just a thought.

|I'm pretty sure it's the power supply that's dead, but I have no idea where
|I can get another one here in the UK.

What sort of ST? Is this an internal PSU or the 'brick' which came
with early models? I'm sure Systems Solutions and TUS will have spare
PSUs.

It would be as well if you could check the PSU before going further.
Has the keyboard LED gone out? Can you detect 5v on pin 7 of the
mouse/joy port? If you can get hold of a voltmeter it's worth looking
inside to see if +5v and +12v exists. Has the PSU fuse blown? Has the
fuse in the mains plug blown? Without knowing a bitmore it's difficult
to know whether it's a 10p job or a 20 quid job!

If it IS the PSU which has blown and you don't want to spend 20 UKP on
a new one you could tink of replacing with an old PC PSU. It would
have to be external, of course, but you can get these from fairs/PC
repairers etc. for about a fiver. They tend to last longer than the
mini ST PSUs, too.

>similar to stuntcar racer which is made by the same people.

I seem to remember trying the link up in RVF and it worked, but it
was along time ago.

I can't really help you but I will say that Stuntcar Racer and RVF
were only distributed by the same people, basically Microprose using
another name, I forget the name. Stuntcar Racer was created by the
God like Geoff Crammond and I guarantee he had nothing to do with
RVF.
I definitely played SCR linked up, even an ST linked to an Amiga, it
was fantastic fun.

There was even the time we linked an ST and Amiga playing Hard
Drivin' 2. With the Amiga 500's CPU being slightly slower than the
ST's it ran at a lower frame rate but when linked we could have sworn
it speeded up to match the ST. Bizarre!

Rich.

It's all in the docs. Basically STING.PRG and STING.INF go in AUTO.
You then edit STING.INF to contain the path of the folder containing
all the *.STX modules. You can run DIALER from anywhere.

Source record: 107567

On 15 Feb 1998 19:06:44, Hallvard Tangeraas wrote:

|Well, once you get started it's not too complicated, but very picky.
|I started out editing the original setup file and changed little by little.
|The most time consuming part is to write the paths of each file by hand.

Yes, as someone else said, it is a great help just to be able to use
the file selector to identify an application EXACTLY. Path names are
not very intuitive and is the bit one normally gets wrong. Then there
is the problem of maintenance - I regularly move apps around or get
new versions. I just want to use a simple maintenance program to keep
SMU's steering file up to date.

|What???????!!!!!!! I didn't even know he had a web page...
|Could you tell us the URL please?

Yes. He is on:

http://www-fs.informatik.uni-teubingen.de/~hunszing/marvin/falcon/
own-software.html

Phew! A long URL.

|If I was a programmer and didn't have time to keep my software updated I
|would at least give it away. Keeping it for myself would be the same as
|having wasted my time making that program in my opinion.

Agreed. He releases a great program which tells you to ask for a key
then tells you that NO keys will be distributed.

Some sort of sick joke?

|Have you tried mailing him? I've tried, but never got a reply. Then again
|my message didn't "bounce", so I'm sure he's received it.

'Fraid I didn't. I would not know how to talk to him after being
deceived so elaborately.

|True. Anyway, I'd be more than happy if he released the key for the German
|version.

Yes. It's easy enough to work out what to do.

|Too true. Let's hope something works out.

I guess Thomas Much should try to release an 'unlocked' version in the
same package as SMU. This would then be a very friendly combination.

STING.PRG and STING.INF must be in the AUTO folder, and must run after
DRVIN.PRG and MFP.PRG (from the HSModem07 package).

STING.INF must be edited to point to wherever you put the rest of sting (say
C:\INTERNET\STING for example).

All the CPX files go into wherever you usually put your CPX files.

All the STX files go into your STING folder.

DIALER.PRG, DIAL.RSC and DIAL.SCR can go wherever you want. The dialer also
runs as an ACC if you rename it, so you can put all that in the root
directory.

Basically all the rest goes into the STING folder.

3261. SIMM upgrade on STFM

Newsgroup: comp.sys.atari.st
Date: 1998-02-15 00:00:00 UTC
From: Alan Hourihane <alanh@fairlite.demon.co.uk>
Message-ID: <887585747.20777.0.nnrp-07.9e9834fc@news.demon.co.uk>
Source record: 107572
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have a 520STFM upgraded to a 1040STFM with DRAM chips and
decoupling capacitors.

I've read that someone had posted a 4MB 72pin SIMM upgrade
for these ST's.

Well, I've done it and it sorta works. I've run CheckST which recognises
4096k of memory. Good.

But, I've connected the /RAS and /CAS lines to +5v with a 10k resistor
(tried a 4.7k one too), but I'm getting static on the screen which is
obviously bit errors in memory, and it's flickering. Some programs are
causing illegal instruction errors which worked before (i.e. 4 bombs).

I'm wondering if the decoupling capacitors left on the old memory could
cause this problem. I've also reduced all the cable lengths from the SIMM
to the shifter/mmu to about 3 inches. I've connected all 3 of the +5v and
GND
lines on the SIMM which seem to reduce the static when all three are
connected,
and gets worse if I disconnect one of them.

Any one got any ideas at all ?

Thanks.

Alan.

-> See even in countries that have gun control, it doesn't work!
-> You will always have people that will use guns the wrong way.
-> We in the US have enough goverment trying to control our lives,
-> we really don't need gun control, we need to have
-> better education and respect for one another.
-> This would go along way in solving our many social problems.

-> D. Moore

We in the U.S. have leaders in our government who gain their power by making everyone the victom of something, anything. Then they can come and claim that they can fix all our problems for us, take away our own responsibility for them and create a program or entitlement to take care of us. They need us to need them on order for them to survive so they create these crisis. Thus the government gets bigger and bigger. If everything was and we could take care of ourselves (which is the way it should be) we really wouldn't need the government as much so they come up with all these social crisis to justify their existence.

Anytime someone, let it be an individual or the government, makes you into a victom they're really telling you how to feel and who you are. The worst form of oppression one can endure is self condemnation, the second worst form of oppression is letting someone else tell you who you are and thus they're controlling you. You can't experience happiness being a victom and you most certainly can't experience prosperity feeling sorry for yourself for something that happened to you. We don't need the government taking away our own responsibilities of life, trying to do for our people what the people don't have the guts to do for themselves. I think that stinks.

Later,
James

>cause the TCP implementations to reset the connection. Basically, it's lost
>after that.

The ICMP messages should only be generated in response to actual IP traffic.
If your phone line drops, and you re-dial and re-establish before any higher
level packets have been transmitted, the connections should continue without
any knowledge of the interruption. E.g., if you have a telnet session, and
you haven't typed anything, and nothing is being sent to you, the connection
is totally idle. If the phone line drops while the TCP connection is idle,
you can reestablish the phone connection without disturbing the TCP
connection. If you try to type while the phone connection is broken, the
TCP connection will be killed. Also, this only works if you get the same IP
address when you re-dial, obviously. My old ISP was like this, but my new
one always hands out a new address, which is a real pain.

>> Sometimes you can wake the connection up quicker after re-establishing
>> the link by pinging the remote host just to let it know you're there.

>Ping has no connection to TCP, so "just to let it know" doesn't work.

True.

>Zmodem simply is incompatible with TCP/IP.

That's a completely meaningless statement. TCP/IP gives you a reliable
bytestream between two points. You can put anything you want onto this
bytestream, including Zmodem protocol, if you wanted to. Telnet is a
virtual terminal protocol layered on top of TCP/IP. Usually this protocol
only gives you a 7-bit channel, but you can enable an 8-bit binary option
on it, and run Zmodem over that. Of course, it's silly to do this, since
you're getting an extra layer of error detection and correction that is
totally unnecessary. (Both TCP and Zmodem perform reliable communication.
In this case, Zmodem's error detection is just wasted processor time
because the TCP stream is already guaranteed to be error-free.)

The answer "use ftp" is still the smartest one, but it's meaningless and
wrong to say "Zmodem is incompatible with TCP/IP."

Ah, so you're a Zmodem protocol expert. Yeah, right. I've ported Zmodem to
the Atari, to Vax/VMS, and a bunch of different variants of Unix, using MIDI,
SCSI, DECnet, TCP, and a bunch of other weird communications layers. Zmodem
is a data communications protocol - all it requires is that you have a
transparent 8-bit wide data path. Beyond that, it doesn't know or care. Nor
should it.

>For the Amiga thing, this is abusing a Telnet connection for simulating a
>serial link. I doubt this will work with anything but two Amigas at both
>ends of the Telnet connection.

I'm sure every Unix user in the world is going to be saddened to learn that
none of their TCP/IP applications are supposed to work. Have you ever heard
of a pseudo-tty? I guess not. How about a "virtual terminal?" Every Unix
telnet implementation "abuses a telnet connection for simulating a serial
link." Telnet itself is a virtual terminal protocol - and a terminal is
implicitly a serial device. Where do you get these crazy notions of what
is or isn't *allowed*?

%you're using the good old UNIX terminal emulation!!
%Since this is possible there probably isn't any reason why it can't be done
%on an ST as well..

No reason at all, except that it's a waste of CPU cycles. In fact I used it
this way through KA9Q net, a long time ago. You could spawn any subprogram
you wanted, and have its stdin and stdout attached to the telnet session.
Most Unix-based telnet clients don't have this feature, since any place that
you can reach with telnet should also have ftp. But it's simple to add.

3273. AUC: SC1224, SM124, Software #1

Newsgroup: comp.sys.atari.st
Date: 1998-02-16 00:00:00 UTC
From: Rob Busam <sirosis@u.washington.edu>
Message-ID: <Pine.A41.3.96a.980216160230.66628B-100000@dante30.u.washington.edu>
Source record: 107395

If anyone would like the updates e-mailed to them let me know.

RULES OF THE AUCTION

1. Minimum increment to bid is $1.00.
2. All items will be shipped via USPS or UPS. Postage is additional as
is insurance if desired. I will give shipping costs within 48 hours
if you are the winning bidder.
3. Items will be shipped with in 24 hours of receiving funds (cashiers
check or money order) or as soon as the check clears if personal check is
used (allow about 10 days for this). No CODS.
4. Please pay close attention to your bids. Because of the size of this
auction it is very easy for me to make a mistake or an omission.
5. I will use the Going, Goingx2, Gone method. This process will begin
Monday, Feb 23, 1998. Every 72 hours will advance the status if I
do not receive any higher bids for the item.
6. I expect everyone to honor their bids once things are at the GOINGx2
or GONE stage. If you don't want an item, PLEASE let me know before this.
7. Buyouts are accepted.
8. The person making the earliest bid settles identical bids.
9. Each update will have the top 3 bidders listed.
10. Please list a name and item number when bidding.
11. Minimum bids listed where applicable.
12. No shoes, no shirt, no service.
13. Smoking allowed.

Greetings Atari Users,

Here is an update to our Good Atari Stuff ForSale List.
More items added to list.

ATARI 2600 Cartridges

These cartridges have no boxes or manuals.
Price for each cartridge is $2.50 or take all 9 cartridges for $18.00.

Boxing
Space Invaders
Pac-Man
PitFall
Warlords
Donkey Kong
Defender
Freeway
Combat

ATARI 7800 Cartridges

These cartridges have no boxes or manuals.
Price for each cartridge is $4.00 or take all 7 cartridges for $20.00.

Food Fight
Hat Trick
Alien Brigade
RoboTron 2084
Mean 18 Golf
Pole Position II (We have 2 of this cartridge)

ATARI 8-bit items
---
3. Eleven Atari 8-bit software titles---------PRICE REDUCED*
MRCA Mach 2 / original disk and manual.
Wayout / original disk and manual.
Mad Magazine's Official Spy vs. Spy / original disk and manual.
Asteroid Miners / original disk and manual.
Round About / original disk and manual.
Micro Shuttle / original disk and instruction card.
Bill Budge PinBall Construction Set / original disk and manual.
Raid over Moscow / original disk and manual.
Menu Writer / original disk, manual and box.

Cut and Paste / 2 original disks, manuals and folder box.
Music Construction Set / original disk, manuals and folder box.
*Price for each title is $5.00. Or take all 11 games for $30.00.

7. PQ The Party Quiz Game
4 push button controllers, Interface, 2 original game disks,
4 sets of extra game disks, Original manual and box
Like new. Price-$20.00

8. Animation Station
Drawing Pad and Pen, Original disk and manual.
Like new. Price-$20.00

Atari ST Game Software
---
9. SuperCars II / Original Disk, manual and box.
Price-$7.00

10. RamPart / Original Disk, manual and box.
Price-$7.00

11. StormBall / Original Disk, manual and box.
Price-$7.00

12. Tetra Quest / Original Disk, manual and box.
Price-$7.00

13. Wanderer / Original Disk, manual, 3D glasses, and box.
Price-$7.00

14. MindWheel / Original Disk and Book.
Price-$7.00

15. Essex / Original Disk and Book.
Price-$7.00

16. Total Recall / Original Disks, manual and box.
Price-$7.00

17. Last Ninja 2 / Original Disks, manual and box.
Price-$7.00

18. R.B.I. Two BaseBall / Original Disk, manual and box.
Price-$8.00

19. Jewels of Darkness / Original Disk, manual and box.
Price-$6.00

20. Damocles / Original Disk, manual and box.
Price-$7.00

21. The Sentry / Original Disk, manual and box.
Price-$6.00

22. Q-Ball / Original Disk, manual and folder box.
Price-$7.00

23. Mortville Manor / Original Disks, manual and folder box.
Price-$7.00

24. Into the Eagles Nest / Original Disk, manual and folder box.
Price-$6.00

25. Cloud Kingdoms / Original disk, Poster instructions and box.
Price-$7.00

26. Monster Pack Volume 1 (includes 3 games)
Shadow of the Beast 1.
Infestation.
Nitro.
All original disks, manual covering all games, and box.
Price-$10.00

27. Zork II / Original disk, manual, box, and etc.
Price-$6.00

30. Beyond Zork / Original disk, manual, box, and etc.
Price-$7.00

31. A Mind Forever Voyaging / Original disk, manual, box and etc.
Price-$7.00

33. SpellBreaker / Original disk, manual, box and etc.
Price-$8.00

34. Perry Mason
The Case of the Mandarin Murder / Original disks, manual and box.
Price-$7.00

35. High Roller / Original disks, manual and box.
Price-$7.00

Atari ST Applications and Utilities

A1. Easy Draw Package
SuperCharged Easy-Draw version 2.24.
Super Charger version 1.01.
Easy Draw Font Pack 1.
Easy Draw Personal Draw-Art 1.
All Original Disks and Manuals in the Original NoteBook.
Price-$15.00

A2. Partner ST / Original Disks and NoteBook Manual.
Price-$8.00

A3. PayRoll Master / Original Disk and NoteBook Manual.
Price-$7.00

A4. Scholastic Series Biology Package
For Grades 8-9

Volume 1 Original disks, manual, and plastic folder box.
Volume 2 Original disks, manual, and plastic folder box.
Volume 3 Original disks, manual, and plastic folder box.
Volume 4 Original disks, manual, and plastic folder box.
Price-$12.00

A5. Photo Show Plus version 1.01 / Original disks, and manual.
Price-$6.00

A6. Slicctop / Original disks and manual.
Price-$9.00

A7. Michtron Package
The Juggler / Original disk, manual, and box.
Michtron Utilities / Original disk and manual.
M-Cache / Original disk and manual.
Tune Up! / Original disk and manual.
PinBall Factory / Original disk and manual.
Price-$15.00

A8. Metacomo Make / Original disk, manual and box.
Price-$5.00

A9. Quick ST II version 2.21 / Original disk and manual.
Price-$5.00

A10. PaintWorks version 1.5 / Original disk, manual and reference card.
Price-$7.00

A11. AutoProgram database / Original disk, manual and container.
Price-$5.00

A12. HelpMate / Original disk and manual.
Price-$7.00

A13. Abbreviator ST version 1.1 / Original disk and manual.
Price-$5.00

A14. AND Fast-Key Shell / Original disk and manual.
Price-$6.00

A15. AND Cash_Register / Original disk and manual.
Price-$6.00

A16. ZoomRacks / Original disk and manual.
Price-$6.00

A17. Thunder! version 1.31 / Original disk and manual.
Price-$6.00

A18. ColorWriter version 1.2 / Original disk and manual.
Price-$5.00

End of list.

A multiscan is a must if using screenblaster due to non-standard resolutions supported. Also nice for that occasional program that only runs on an RGB monitor. Otherwise, the standard Falcon VGA modes work fine on an ordinary VGA monitor. Check the multiscans frequencies supported versus your screenblaster docs.

fowler@u.arizona.edu wrote:

This is possible if your ISP's modem server does not send back ICMP messages
to the server in case of a lost connection, or if it does it later. Not
sending them at all is pretty bad I'd say, as then only timing out helps.

Anyway if you get your IP address dynamically assigned, then after relogin
you might get a new, different, IP address. At least in that case the TCP
connections are definitely lost, and cannot be resumed.

> Is this related to the stuff going on in the other thread about
> reboots/reconnections where it's emerged that Demon in the UK is odd
> (though convenient) in this respect?

Not really, as TCP is a different abstraction layer than the physical link.
And I won't call Demon's behaviour odd, it's just uncommon.

>>> Sometimes you can wake the connection up quicker after re-establishing
>>> the link by pinging the remote host just to let it know you're there.
>>
>>Ping has no connection to TCP, so "just to let it know" doesn't work.
>
> This was a subjective impression.

I'm merely saying that interpretation is wrong. The effect is there, I've
seen it too occasionly after the connection apparently has "stalled". But
the origins are definitely somewhere else. My conclusion was that some IP
traffic congestion that happened at some router on the way to the other end
is dissolved by ICMP packets traveling the same route, probably due to the
higher precedence that often are given to ICMP packets. If this is true,
then it's certainly a highly router implementation dependent feature.

But I might be wrong too, I don't really know.

Yes. It calls STiK/STinGs resolve() function which you can consider a system
call here.

> And I thought if STiNG did
> this fabulously nifty trick, rather than depending on the author of the
> CAB.OVL to do it,

What do you think the resolve() should return to the caller in that case
(while the resolve action is still going on) ? Should it return resolve
successful (and which IP address to return then), or should it return
resolve failed ?

Apart from that difficulty of the definition, the resolve call as a system
call must not make assumptions on the way it is called. The current imple-
mentation can be called from an interrupt if you carefully taylor your code.
This is gonna be impossible as soon as OS calls like lauching a thread are
involved.

There are more detail difficulties, for instance lauching a MagiC thread is
an AES call, but the resolve call has no info whatsoever on the AES variables
of the calling application. The latter might not even have any, if it's a
*.TOS or *.TTP program.

> then other programs that used STiNG could benefit as
> well. Programs such as A-FTP (which also stalls during the resolve), and
> TelStar (which _also_ stalls during the resolve). Who wrote TelStar? I
> don't think it was Howard Chu, or Dan Ackerman. Ah, it must have been
> Boris Cahan ;-)

What you're asking for is impossible, mainly for the above mentioned reasons. Sure, the resolve call could be split into separate functions such that program flow control is returned to the application again and again until the resolve is finished. But that's a completely different way of doing the resolve, and parts of each application had to be rewritten to use it (which is a very unlikely thing to happen). And - what do you want ? Sure TelStar "stalls" during a resolve action. But a) a resolve seldom takes longer than a couple of seconds, and b) it does not affect any other application on the machine (while resolving, you can carry on editing some text etc.), and c) there are very few sensible things an application can do while resolving.

I have a few things on TelStar's to-do list. I think I'll add a background resolve, just to study what kind of effort is involved to do this. I do not expect it being exceedingly difficult though. Guess I should make that bit of code available so that every client author can put it into his/her client.

> present in memory even on a singletasking computer, ready to do its
> resolving business behind the scenes while the GEM application (CAB or what
> have you) would then be free to read mouse actions and such so as to keep
> all the window gadgets functioning.

The clients must actively support this. There is no way of doing this simply by bending vectors or whatever. In case of web browsing, the client is CAB.OVL and Howard apparently has done a good job on supporting this. Unfortunately, CAB.OVL for STiK/STinG does not support it.

> Anyway, just a thought. Probably the new version of the STiNG software

Are you talking about addresses ?

> assume to be the "standard" way to allocate fast ram.

There is only one proper, standard way to allocate fast RAM : Do a Mxalloc()
to get a chunk of it. *NO* assumptions on addresses being fast RAM are
allowed, let alone being "standard". It'd take me little effort to fit some
fast RAM into one of my machines at, say, $00600000. It add it to the system
by calling Maddalt(), and all programs that use standard methods will use
it.

Anyway this is all completely unrealated to Magnus's problem with MagiC and
cachable FRBs.

Irrelevant. No one's suggesting reformatting lines just for the sake of reformatting them. We're talking about wrapping lines that are too long. If you want tables, you use hard CR/LFs at the end of each line, and the reader should not wrap those lines, assuming they're not too long.

PR> That would be an acceptable compromise I suppose, but I guess people
PR> weren't quite happy with it when they discover that even carefully

PR> anymore.

They shouldn't be reformatted at all, if they're kept at a reasonable length. The program I'm using, LED, shows tables just fine. But it also wraps long lines and unformatted paragraphs just fine, too. It only wraps when necessary, as any decent reader should.

Hi Peter,

maybe I'm not a programmer enough (and I'm NOT a programmer) but I can't follow
you here:
am I thinking wrong when I consider TT-RAM as the Fast-RAM? I always did so, so
your statement doesn't make any sense to me. Or am I completely wrong here?

What I checked is what all the MagiC stuff does, and all PRG's, APP.s have from
installation "Malloc alt" and "load alt" by default... And I'm referring to
Magxboot, and all the additional stuff put on the HD after installation of
MagiC!

Please enlighten me :-)

Look for them in your email! I didn't test them with a 660C though.

Ditch the DSP-speeder, as it only runs the DSP at the current
system-clock (32, 40 or 48/50 MHz). Install a permanent 50MHz
oscillator instead, it works with absolutely everything I've tried it
with and gives top performance independent of the system-clock.

Do they have to be pulled up? When I did a similar mod. I don't
remember doing this - just a straight connect to RAS/CAS on the new
banks.

Are your +5v lines to the RAM thick enough? I found I had to use 15A
wiring to avoid transients. Also, take the +5v from somewhere early in
the power tracks. I took mine from the + of the big decoupler close to
the power supply. The same goes for the GND line.

Ah. Can't you just disconnect them. This bias may be finding its way
back to the new RAM's RAS/CAS.

3308. TAF Meeting February 18th - Games Night

Newsgroup: comp.sys.atari.st
Date: 1998-02-16 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <34e8538a.0@nemo.idirect.com>
Source record: 107452

Upcoming TAF Meetings!

A big THANK YOU for all of you who came out to the January TAF meeting! We had a real ball at the Internet Night, with many coming away saying that this was the best presentation TAF has put on in a long time - and it was certainly one of the best-attended, with people still hanging around by 11 PM asking all sorts of questions. A big THANK YOU as well to Martin-Eric Racine, who volunteered his time and came all the way from Montreal to do this very important topic.

And now here's what's up and coming to TAF meetings in the near future....

FEB. 18th - we're having a demo of a number of games for the Atari, including the demo of RUNNING for the Falcon! Plus we hope to have MIDIMAZE up and running as a tourney. See how you can have FUN!

MARCH 18TH - we'll be looking at building SCSI-based hard drives at this meeting! What with the dropping prices on drive mechanisms, now is the best time to solve your media problems and make your Atari system more productive. We may even have a surprise guest to cover one aspect of SCSI (hint - CD-ROM!).

APRIL 15TH - we've confirmed a very special presentation by CLUB CUBASE! The capable members of this user group will show us a demo of CUBASE AUDIO 16 to show us just how well the Falcon can handle integrated hard disk recording and sequencing. They'll also have product available for sale at this meeting as well.....

MAY 20TH - TAF Election Night! Exercise your right to vote and maintain your executive. Also - a presentation by MICHAEL BURKLEY of SUZY B'S SOFTWARE, the US' most popular Atari PD/Shareware house, who's sure to have some entertaining tales to tell...Dan may also have a few tales to tell on his latest UK trip....

JUNE 17TH - who knows? If you have a suggestion for this night (a specific topic? Another Flea Market?) by all means let us know!

As always, if you have any suggestions for a TAF presentation, or want to volunteer to give a presentation, by all means let us know! The executive always appreciates input from its membership. Get in touch with Dan Dreibelbis at 416-766-4743 (he's got an answering machine now, so leave a message and he'll get back to you) or e-mail him at dreibel@idirect.com .

How do I boot up using 32-bit addresses? Currently, I come up in
24-bit and have to manually switch to 32-bit.

Terry,

Check your Auto folder as you may have the "24 bit program" sitting in there. A TT default's mode is 32 bit - to make it come up in 24 bit requires running a special program at start up. Additionally I seem to remember a "Compatability Mode" that was accessable from MagiCDesk. As I don't use it (much prefer NeoDesk) and I cannot find my MagiC 4 manual at the moment, that might also be the sourse of you problem.m The 24 bit mode was designed to allow some older ST software to run on the TT's.

Anyone know why my Nova card might not display anything when I have
the jumpers set to the TT position? I can only get it to work in the
MSTe position, or with the jumper totally removed. Using either of
these two options, I can't get more than 256 colors. Moving the
jumper to the TT position just gives me a black screen. Are the
drivers jumper position specific, and I just don't have any available
for the TT position?

Terry,

Nima Monaster would be the best person to answer this one, but I think
it is card specific. My Nova which is a 32 bit has the jumper set
for a Mega instead of a TT. I think it has to do with the type of video
processor on the card - but I am not sure.

Getting more than 256 colors is not a function of the jumper setting. It
is a function of getting the correct setup in VGM_TT program and the amount of memory
on the card.

And what does those diskzine-shells consist of? Animations, scrollers,
music, sprites... Much like a game really, and exactly the thing STOS
is good at. But try booting one of those shells on my
Falcon/Afterburner...

>>of any language that is subject to the same restrictions. What STOS

> No restrictions here mate? :)

Well, try writing a threaded GEM-application in STOS... I'm sure it
can be done with a lot of pokes and peeks, but I prefer using a
language designed for "serious" (flamebait!) programming and save
myself a lot of time and problems.

And the other way around: If I want to write a
hardware-dependent platform-game I'd probably do it in STOS with one
of those (pretty cool I have to admit) extensions. It can be done in C
as well, but then I'd have to spend a lot of time writing a
graphics-library and reinventing the wheel. But if somebody wrote such
a library for me I'd use C...

Hello-

I'm a long-time ATARI ST owner who's still finding ways to use the machine. Although I have had years of using Dr. T's X-OR universal editor/librarian with my various synths, I'm now in possesion of a device not supported by the existing X-OR profiles (as far as I know): AKAI S612 sampler. Does anyone know where I might find a copy of Drumworks SoundfilerST for the S612? Anybody writing new profiles for X-OR by any chance?

Alternately, I'm hoping that someone can steer me towards a copy of Pixel Publications "Super Librarian" for the ST. This librarian contains a profile for the AKAI S-612 sampler, something that would ease my pain considerably...

Any other thoughts on how to efficiently save S612 patches to my ST would be greatly appreciated.

-thanks

Simon Walton <simon.walton@zetnet.co.uk> wrote:
: I've tried dropping it on top of GZIP.TTP with no luck.
: Do I need to use a minix partition to unpack it into ?

No. you just have to rename it to FREEMINT.TGZ or MINT114.TGZ.

Gzip checks the ending of the Filename. If it is not something it
recognizes (like .z, .gz, .tgz, and maybe som other) it wont unpack it.
You still will then have a TAR archive. to unpack this it might be
neccessary to have long filenames. I don't know if you have a source
or a binary distribution. The source seems to need long filenames
The Bin won't (I guess).

No...you cannot connect a harddisk this way, because the small connector you describe is a DMA
connector ! this, if you want to connect a HD (and ONLy a SCSI), you need a DMA -> SCSI adapter...
And forget to add an EIDE, because with Mega ST, there arn't such interface, and doesn't exist adapter IDE. The only Atari can accept IDE is the Falcon.

So, try to find a DMA-> SCSI adapter, such top-link...And get a SCSI Hard disk !

Hi,

>The guy I'm buying it from says it has a graphics card. With this option
>I can fit an PC VGA monitor on to the machine. Is this right? Will I be
>able to use Music progs. (as Cubase) with it (High res. mode)?

Yes, there are graphics cards that fit into the VME bus of the MegaSTE.
This is a very valuable addition to a MegaSTE. I run routinely a Nova card
in my MegaSTE, with 1024x768 in 256 colors on a 17" multisync.
However, not all programs are graphics cards compatible. Generally speaking,
you need to have also a regular SM124 mono monitor hooked to the computer.
It will be very useful to follow the boot procedure, to interact with any
boot manager, and to run software not compatible with the graphics card.

For Cubase, I don't know for sure, but probably it is not compatible.

Hope this helps.

>but does it use 32 bit or 36 bit or EDO, and does it take 16 as a max, or
>can it goto 32). I am also wondering how easy or hard this unit is to
>install and if it requires a specific version of TOS (Its going into a
>Mega STe with 2.05).

Yes, there exists a Magnum card specific to the MegaSTE.
Sorry, I don't have the card yet (see another message that I am going to post
on the subject), but still I have some information.

The card is announced as 12MB. However, the way Aixit explains that is unclear:
I still don't know if it is 12MB total or 12MB extra, i.e. 16MB total...

Aixit also says: "...very easy, no soldering, just plug and play..." (I quote).

I know for sure that you MUST have TOS 2.06. This is because 2.05 does not
understand the system call Maddalt() which is necessary to have the extra RAM
recognized by TOS.

Hope this helps.

Hi everybody,

Recently, I contacted Aixit in Germany. I wanted to buy their new RAM expansion board for the MegaSTE.

They answered within 2 days, no problem. After a few e-mail exchanges, I ordered the card with payment by COD. They answered: "order accepted, we will send the product".

Well, that was 2 months ago. The product never comes, and now they don't answer to my e-mails anymore.

Any news, anybody? Thanks in advance.

Cheers.

I am sorry. I do not know enough to give here a good answer on. What
you could try is to use only the programs you need for Sting. It could
be the case that an autofolder program or an accesoire is doing
something bad. If this does not help, try contactinging the authors.
As I said, I did not have many problems. Biggest problem was that I
did not understand everything (maybe I wanted to go to fast), but when
I filled in everything proberly, I did not have real problems.

3327. How to repair Megafile 30/ 16 MHz for ST?

Newsgroup: comp.sys.atari.st
Date: 1998-02-16 00:00:00 UTC
From: a187340@hotmail.com
Message-ID: <6ca2fb$f05$1@orthanc.reference.com>
Source record: 107471
Cross-posted to: comp.sys.atari.st,de.comp.sys.st,comp.sys.atari.st.tech

Hi folks,

1. is there some information on www how to repair a
Megafile disk? If not, is the a book with some help?

2. I have heard about a possibility of using a 16 MHz
CPU for Mega ST - there are some cards and a kit to do this.
Does someone knows where to buy/obtain such cards?

Thanks and advance,
Artur

(...recently I was given a gift - 30 MB Megafile harddisk.
Unfortunately, after few hours the disk refused to work.
An examination showed that when connecting the 5V/12V
power supply cables from the mainboard, the 5V goes down
to 0.5V... I guess the power supply is out of order.)

After buying quite a few computers i've accumulated duplicates of

these items so their up for sale. I need the space!!! They goes
as follows:

Hardware: All with Manuals

* Mega ST 2 ..... $275
* Atari 1040STf (1 Meg) ..... $ 65
* Color Monitor (Atari) .....$ 40
* Black & White Monitor ..... $ 25
* Atari SM804 w/Outburst..... $225
(Needs new drum and toner)

Hardware: No Manuals

* External Disk Drive ..... $ 25
* External disk Drive (Needs Power Adapter, Radio Shack) . $ 10
* Black and White Monitor ..... $ 35

Software: All With Manuals

* Easy Draw ..... $ 10
* Degas Elite ..... $ 10
* Typesetter St ..... $ 10
* Stalker/Telecommunication Software ..... $ 20
* G+Plus ..... $ 10
* Migraph OCR/Optical Character Recognition Software ..... $ 10
* Mr Boston Official Bartender's Guide ..... $ 2
* The Juggler ..... $ 5
* Geneva/(Multi Tasking Program) & NeoDesk(Desk Top Prg .. $ 50

Software/No Manuals:

* Hybrid Arts Ludwig Music software ..... $ 3

Games: All with Manuals

* F-15 Strike Eagle Flight Simulator ..... $ 10
* Elite/A Fantastic Voyage ..... $ 10
* Defender Of The Crown/Knight Fight ..... $ 10
* Knightmare/Knight Fight ..... $ 10
* ShadowLands/Barbarian Fighting ..... $ 10
* Barbarian/Fighting ..... $ 10
* Lemmings/Maze and Building ..... $ 10
* Ultra V Warrior of Destiny/Knights ..... $ 10
* Baby Jo/Baby Super Hero ..... $ 10
* Drakkhen/Dragons ..... $ 10

* The Pawn/Good and Evil Fight ..... $ 10
* Dragon Of Flame ..... $ 10
* Breach ..... $ 10
* Star Fleet ..... $ 10
* Time Bandit ..... $ 10
* Quest Glory ..... $ 10
* Romancing The Throne ..... $ 10

Games Disk only:

* Dragon Master ..... $ 5
* Rambo 3 ..... $ 5

Programing Software & Book Combination:

* Mark Williams C Compiler/4 Disk/ and Update (2 Disk)
Mark Williams C For The Atari ..... $ 25

* CSD C Source Debugger1 Disk
Mark Williams CSD C Source Debugger For The Atari ST ..... $ 20

Programing Books:

* Prospero C, Language, AES Bining, Library, VDI Binding . $ 25
* Atari ST Internals/The Authoritative Insider guide ..... $ 10
* Atari ST Graphics & Sound/Mastering Capabilities ..... $ 10
* Peeks & Pokes/Hidden Secrets with in the Atari ..... $ 10
* Atari ST Application Programming ..... $ 10
* Atari ST Gem Programmer Reference ..... $ 10

Software Books with no Disks:

* Mark Williams resource Editor For The Atari ..... $ 3

Willing to work on package prices. Buyer(s) pays postage!! All reasonable offers will be considered!!!

Hi
I test all my web pages with CAB...But I only have access to the internet by PC, this has done fine for many a year, But I just added something to the web page that has to be tested on line only, this I can't do with my ATARI so can someone please test the "Search" function on the ST+ web pages at
http://www.users.zetnet.co.uk/paxton/stp/index.html

You will find the searcher at the "These Pages" section,

Just needs testing on line with CAB.. anter a word Like Fanzine or summat and see if it generates a list of pages on site that contains that word, or any other you think appropriate..fanx!

Thanks Branko,

It was exactly this, I've now connected my GND lines to three different
places, one
to one of the ROM chips, a second to the LS244 and a third to the MMU and
I've
connected the +5v to another three places and this cured it. I'd never have
believed it.

Thanks again.

Alan.

|(eide) to the atari and what else might i need to do it?

NO! The 19-pin output is DMA which supports a 'sort' of SCSI known as
ACSI.

You need to have a host-adapter card attached to the 19-pin, this will
have a normal 50-way SCSI output. The host-adapter currently being
marketed is th 'Link 2' but you might well find second-user versions
of earlier h-a's called AdSCSI (ICD), Supra, GE-Soft etc.

Source record: 107481

There is a new game from Reservoir gods, It's Super mario bros,
actually they didn't do thegame itself, it is not a port, it's an
emulation of the NES video console.
The game so far IS kind of implemented WITH the emulator, because this
lastone is not 100% ready and flexible enough to run any NES game from
images.
But so far, so good, it is color, sound NOT emulated yet, however
there is a nice music added to it, played on the dsp of course., not
the original, but well :)
Well anyway get it, try it. It's called godlynes, the filename is
smb.lzh and you can get it at:
http://www.users.zetnet.co.uk/zmoe3/three.htm
Thanks

All depends on what's wrong. If the drive mechanism is dead, you can replace
it with a "new old" RLL drive, which will probably be a bit difficult to
find. It would probably be better to consider upgrading to a SCSI drive. If
it's the PSU, then you can replace the PSU with one from an old Atari ST.

>2. I have heard about a possibility of using a 16 MHz

It's all in the Quick FAQ.

IDE seems to be out of question on a Mega ST, unless there is an adapter board somewhere, which I doubt. The usual solution is either SCSI with a special SCSI adapter, or DMA/ACSI (Atari's proprietary standard) with an old Atari HD.

Cheers,
Nick

(Different type of 32bit question:).

Ok, I have a question too. (Maybe Nima forgot to answer when I mailed
him). I have a Super Nova (4mb V-RAM ATI Mach 64) and cannot get any
higer color mode than 1024*768 64K. I tried the VMG with many settings
but all I ever get is a blank screen. 800*600 can only achive 24bit
(32bit is possible). 640*480 works in 24 and 32bit. I am beginning to
suspect a bad 2mb memory module. I would think that it is not a
monitor problem if I can get 1024*768 64K to display properly. This is
on a Falcon with the latest VDI drivers.

Dave Gostl (dbg01@gnofn.org) wrote:
: Yes, I have the 3.53B and even patched the GTP so it runs from the J:\ drive.
: But still it won't show PDF's.

It definitely will NOT show multiple page PDF's and it might not show PDF's that are produced using the Mac version of Acrobat. A good test to see whether or not it works is to produce a one page PS file (using only Helvetica font) and upload it to ftp.babinszki.com (don't forget the "sz" in the name) using the "put" command - remember the ps file is text so don't use binary transfer. You can pick up the file at http://www.babinszki.com a few minutes later. This is a free service.

I produced a lot of ps to pdf files and found that acrobat 2.1 on the pc was the only version that seemed to produce pdf files that GS could read and these had to be single paged. If anyone knows any different, then please let me know.

It is not necessary to type the path names manually. Just use qed. qed allows Drag & Drop with a pressed Shift key from a desktop window (of Jinnee, MagiCDesk, Thing...) and displays the path and filename in the qed window.

So it is very easy to create a complete new START.SET.

AFAIK I described the whole procedure in the hypertext and Joe translated it.

Use several GND wires from each GND terminal on the SIMM to near neighborhood

of the SIMM. I ussually connect SIMMs GND to nearest GND, to GND of MMU's blocking
cap, etc, and same goes for Vcc. Do not be afraid of overdoing it here, because it needs solid
GND. This is essential
since GND plays two roles; its one of power supply lines and it is voltage reference point
for all other signals. Since SIMM's power consumption varies greatly and very fast, inductance
on power lines (especially GND) can play nasty tricks on you.
If that does not cure problems completely, you can try series resistors in all active RAS and CAS
lines and all address lines (A0-A9), if they are not already on the PCB very near MMU. In that case
just pick up the signals after they propagate through resistors. Usually there are 33 Ohm res. on address
lines an address lines, 68 Ohm on CAS lines and 68 Ohms or nothing on RAS lines (depending on PCB rev.)
Rams do not like transitions on that lines that are too fast (usually they must be between 1 and
10 ns), otherwise they can overlook it... Oh yes, resistor value should be around 68 ohms.
If ther is resistor in the board already, don't add another, as it is unlikely that it would help.
Try instead shorting resistors in RAS or CAS or both lines. I have noticed that some drams do not like
them when talking with ST's MMU. You can experiment with RAS & CAS lines but surely leave resistors
in address lines...

I don't understand why would you need pullups for RAS & CAS.. If you are reffering to signals
of old drams then resistor value is not so important. It can be 10K, 1K, 100 Ohms or 0 Ohms.
I know that direct tying it to Vcc is not preferred, but works every time without problem.
What is important is that you cut RAS & CAS traces between MMU and old RAMs, so that
old cas/ras do not influence new.
If you haven't done it before, add small tantal cap. (let's say 10 microF/10V) on GND/VCC
on the SIMM's terminals or in the nearest vicinity. Decoupling capacitors are

other thing that
you can't overdo as they take role of power reservoar at current peak until
inductant nature
of power supply lines calms down.
One other thing. Dram can't be 100% tested, especially not with ST's crappy
RAM diagnostic
software, so don't rely too much on it when it tells you that all is O.K.

Hope this helps,

Branko

Good idea. I'm down to 158k free on a 32Mb C:\ partition with 6Mb of Autos,
Accs and CPXs, 8Mb of BTFONTS, 7Mb of GEMSYS and Drivers, 4Mb of CPXs and
more. I could do with the space!

n> 3 I've put aliases of STinG's DIALER.APP and DIAL.INF in my CAB

PR> Is that your's to judge? Are you claiming you know all the
PR> implications?

Hardly, but you make the usual mistake of thinking that I'm saying that it should be a free for all. Both the reader and the writer have a responsibility in this and the solution need only be affected by the medium that is used to connect them - the Net.

PR> I guess you have never used mail in an environment where the line
PR> length really matters.

It has to be said, Peter, that too many people spend too much time caring about some vague possibility somewhere at the end of the rainbow.

I do not believe that anyone, even on the humblest ZX Spectrum to the most advanced workstation, who's managed to get themselves on the Net, is on such an incapable platform that they are unable to have a message editor/reader that cannot also have line-wrap. It's unthinkable. It is a programming problem, not an Internet problem. The Internet is just a stumbling block that has to be overcome.

>> I would say that it's down to ASH to make their EMailer write with
>> any line length showing on screen that they want, but to convert it
>> to a maximum 80 character length on saving/exporting.
PR>
PR> That would be an acceptable compromise I suppose...

Thank you for proving my point. I'm well aware that we have a great number of talented programmers - they should set their minds to solving problems that need to be solved. You did it with STinG, now people who maintain editor/readers have to do the same and stop whinging.

PR> but I guess people weren't quite happy with it when they discover
PR> that even carefully crafted ASCII tables are reformatted too such
PR> that they can't be read anymore.

That's just badly thought-out programming. It should never happen and it's not beyond the intelligence of any programmer to conform to the standard when in the Internet's environment, without compromising the ease of use of the

software when it's in its own environment.

Sometimes we, as ordinary users, need to be grateful to the programmers that support us, but sometimes we need point out the over-riding priorities. It can be done - do it.

I tuned in late, but NBC Dateline was doing a spoof about tabaco companies it think. Anyway when I got to NBC, there was an Atari 800, looking brand new, with someone playing packman on national TV. I didn't catch what the correspondent was refering to, but he use the term "Atari Generation". Cool.
Bet Apple wishes they could get this kind of coverage and Icon attached to their name:).

If anyone saw the whole segment, please fill in.

Okay. I've had it with constantly having to defend my Atari computer
against those who use Windows based computers.....

James,

I think all of us have similar experiences :) - however, when you show
these clowns exactly what can be done with an Atari, it generally
produces stunned silence. I guess my best example was (is) Calamus SL. I
had been using it to produce documents (technical and otherwise) for the
company I work for, at home, as I found PageMaker and Quark far to
cumbersom and slow to use on the computers at work (486 DX100 and a
Power PC Mac 6800). I got the PC upgrade of Calamus special last year
and installed it on a machine at work. It was kind of fun to see my
co-workers faces as I demonstrated Calamus's power and pointed out to
them that this has been available to Atari users for a long time.

In certain areas, DTP/music/graphics/word processing/ Atari programs and
the machines they run on are competitive with anything available on the
"other" platforms. Although they may not have all the bells and whistles
that MS and others try to cram into their programs - the Atari programs are easy
to learn and master, and allow you to get from points A to Z a whole
heck of a lot faster. A case in point is MS Word or Lotus's Word Pro. A
full install of either of these programs requires from 65 to 100 mbytes
of hd space. And what can you do with these elephants that cannot be
done with Calligrapher or Papyrus - not a heck of lot. In fact, when you
get to that point you really should be using Calamus or DA's LayOut
anyway :).

I did have one funny experience - when I first tried getting an internet
connection using STiK, AntMail, and one of the first versions of CAB
about 1 1/2 years ago I ran into all kinds of problems. A call to my ISP
got me a knowledgable service tech (that in itself was unusual). I explained my
problems and, of course, the first thing out of his mouth was "what kind of computer" was
I using. When I said "an Atari TT" there was a about 10 seconds of
silence on his end and the reply "a TT! Wow, how do you like it - I've
always wanted one of those - how does it work - can you still get
software for it....." My phone conversation with him lasted almost 1/2
an hour, of which 3 minutes were spent finding my problem :).

]-have the adaptor to connect it to a PC monitor and I as well have
]-ScreenBlaster II. I will be using my Falcon mostly for school work and the
]-internet (CAB 2.5), but always thiking about doing more. My brother
]-suggests I get a good multiscan monitor. Any suggestions for a novice
]-atarian. thanx ahead of time for any responces.

I just picked up an Electrohome GPM1701 monitor from Software Hut. Its a
17" multisynch monitor which works great with the Falcon. Its a bit high,
at $679.00, but it gives you the ability to do RGB and SVGA on one single
monitor. If thats too high, they also offer a 14" model for less, and it
includes built-in speakers, AFAIR... Have fun! ;-)

]-
]-Charles
]-EoF
]-.

What Charles says...if you own a Falcon 030, it deserves this upgrade. I had mine installed by Alex Yu at ATY Computers. He did a very good job. I read the docs, and decided it was too much for this poor Atarian to try!

The only programs that I've found that absolutely will not work are a very few demo-style programs. Almost 100 percent compatibility, and almost all progams will work better.

One word of caution. If you have a Chro-Magic RAM Gizmo memory card, and are using 80ns SIMMs, you won't be able to run in Nemesis -HI-, only in -LO-... Titan Design recommends RAM boards that use 72-pin SIMMs (even EDO RAM). However, I've heard a few Ram Gizmo owners that use 60 and 70ns SIMMs in their boards say this works fine. I've got a Ram Gizmo, and my SIMMs are 80ns and it definitely causes problems. I'm getting ready to switch out to 60ns SIMMs, I'll post here if it works okay...

Get Nemesis, you'll never look back... ;-)

>Mega STe with 2.05).

You can't put more than about 15MB of RAM in any 1040/Mega ST/STE computer
unless you exchange the CPU.

The Magnum STE is plugged into the CPU socket, the CPU is then placed in the
socket on the card - that's all. The card takes one (1) PS/2 style SIMM (32
or 36 bits, FPM or EDO, 70ns is fast enough). You can use a 4MB or 8MB SIMM,
the memory is added to your existing ST-RAM (and it's double the speed of
the ST-RAM).

You need TOS 2.06 for the card to work.

>The only people I see who have it for order is Woller & Link over in Germany.

You can get the card from other vendors - one being aixit, www.aixit.com.

I had Nemesis installed into my Falcon whilst on a trip to the UK in
December 97 . I can't say that my machine has been trouble free since
installation. I find that Emagic Logic is unstable if Nemesis is switched
onto Hi (it seems to be OK on low setting)
In the past two weeks it has been extremely hot here with temperatures in
the very high 30's (degrees C that is !!). I found during that period that
after a couple of hours use the Falcon would not reboot with Nemesis set to
high but would if set to low. If I let the machine cool down for 30 mins.
or so it would be OK.
I am using Superboot so have preset the boot conditions depending on what
I'm doing on any particular session. At the moment I have all the std
settings for boot up set to low ..just in case !!
Good luck with the installation.

Hey! hall@post1.com (Hallvard Tangeraas) wasn't it 17 Feb 1998
18:06:04 +0100 that you wrote:

>Let's all try to reach him via email again and then see what happens.
>Anyone else have views on exchanging a freeware key in this situation?

I released a game (Billy Boy) that needed a freeware key, I disabled
SAVE GAME options until they asked for a key, this could be done by
email or anyway they liked, Everyone thats asked for the key got it
within 24hrs of asking :)

The reason was to encourage feedback,

If everyone passes the key around then it absoloutly defeats the
object of the exercise no matter what that is, Personaly I made it so
when the key is used it displays your name in big letters on boot up,
this shames anyone copying it into getting an original <smile>

however if the author is none existant and can not be contacted then
thats his fault....and I would consider it ok to copy the key

BTW I asked lots of people if they could crack the key... they
couldn't.....good old STOS eh :))))

This sounds like a problem I had when I first started wandering around on
the web. I had this on quite a few sites, and I could never figure out what
was causing it. It was only when I changed the CAB.OVL to v1.26 from v1.25
that this problem disappeared. I won't say that this _is_ the source of the
problem, but it could be.

Sadly there is always a disavantage ... Video Master cannot use TTRAM
:(
Before I had a TT I owned a Mega STE with a 10Mb memory card expansion
which was ST RAM and then I was able to use this RAM making some
really big movies ... you must also be aware that Guillaume Tello's
M_PLAYER is able to read this kind of generated movies ;)

I've used a Phillips CM8833 Mk1 and it was OK, but it had to be interlaced to run 640x480, now I've got a 17" NEC Multiscan 5FGe, and it is awesome. Like sitting in front of a cinema screen......
It runs 800x600 using Nemesis and Videlity, and plenty of higher res's too, and the picture at 640x480 is great...

> attached?

You had nothing attached to the message I was quoting, but to the initial
message. I did not look for details when I first say it, and forgot that
there was something when the thread went on. Anyway you forgot to tell
what the code is supposed to do.

A quick check shows that the code apparently will say "Error!" on all
machines, except TTs with precisely 32 MB Fast-RAM. I cannot really
figure out what it does, not least because you're using system variables
that are not officially documented (something I'd call hazardeous pro-
gramming). All ___md ($49e), remtop ($5a4) and remvalid ($5a8) are known,
but not documented, so if your program does weird things, you cannot blame
MagiC, Andreas Kromke is allowed to use these variables in any way, even
if it's in no way related to Fast-RAM issues.

You've mentioned Linux too, which is a particularly bad example in this
context, as it uses entirely it's own means to access and scan for RAM.

>>> assume to be the "standard" way to allocate fast ram.
>>
>>There is only one proper, standard way to allocate fast RAM : Do a Mxalloc()
>>to get a chunk of it. *NO* assumptions on addresses being fast RAM are
>>allowed, let alone being "standard". It'd take me little effort to fit some

>>by calling Maddalt(), and all programs that use standard methods will use
>>it.
>
> So, what your saying is the MagiC dosen't use "standard methods" and
> is not able to utilize fast ram added to the system with Maddalt()
> with a Mxalloc() call?

No. Dunno how you managed to read this out of my words. But I might have
misunderstood too, in the context of looking for Fast-RAM. What I mean is
no software must use that "standard" method :

> As most software recognizes this method, and the ones that do not
> usually don't work from "real" TT fast ram, I assume (make an ass out

of assuming that a certain address is RAM just because it's a TT (say).
This is the OS' task, and no other program, be it system tool or downright
application, is allowed to make any such assumptions. For using it, it must
fetch some using Mxalloc(), that was all I said.

If someone adds RAM at some specific address, he must write or configure
his software to Maddalt precisely this new bit of RAM. No software is smart
enough to properly scan for RAM that can safely be handed over to Maddalt.
Code that would attempt it, would hand over all RAM it finds, even RAM that
is added by hardware add-ons like graphics cards or ethernet hardware (Riebl
for instance). This hardware won't work anymore, because the driver for the
hardware *must* have the exclusive rights to access this RAM.

>>Anyway this is all completely unrealated to Magnus's problem with MagiC and
>>cachable FRBs.
>
> Ahh, I though you understood:). This is entirely the problem with
> MagiC and FRB's.

Then please be a little more elaborate. I indeed fail to see the connection.
This was all about scanning RAM, handing it over to the OS and whether any
particular machine should have 32 MB of Fast-RAM starting at $1000000, which
a priori has no connection to caching of RAM.

Cheers Peter

> If your phone line drops, and you re-dial and re-establish before any higher
> level packets have been transmitted, the connections should continue without
> any knowledge of the interruption. E.g., if you have a telnet session, and

Two needs for a comment ;-) : This can be true of course only if one gets the
same IP address as before. Otherwise the connection is absolutely impossible
to resume. Since virtually all people who access the net from home have
dynamically assigned IP addresses, likelyhood is great that the attempt
will fail. I see that you noted it, but it really should be stressed that
very very few people will get back the same IP address, so this is a very
unlikely thing to succeed.

Second, you're talking about telnet, with which you can be lucky enough to
be caught by the hangup while the connection is idle, and the server is not
expected to send anything because the current command has been entirely
processed. The guy here however was talking about FTP, and for most people
the whole Internet is simply WWW, both being services with which the connection
is virtually never idle (concerning ftp, I'm talking about the data connection)
of course.

So all these things make it a sensible statement to say that TCP connections
across IP phone connections cannot be resumed after a redial. The rare
exceptions do not justify letting people to try hard to succeed here IMHO ;-)

But this thing you cannot really blame STinG for. It is because your AES
replacement refuses to taskswitch to other running programs, even though
the Resolver relinguished control to the AES (which it definitely does !).
Sure, preemptive multitasking is a good thing, but I do not need it here.
I can switch MagiC's preemptive multitasking off, and still multitask while
the Resolver is doing it's work (blocking only the resolving application).
Even on single-TOS (!) I can happily use accessories, while CAB resolves
a domain name. So clearly your AES is at fault here. Tell the programmer
to implement _appl_yield() which has been in every TOS version up to now,
and also every KAOS and MagiC version.

> : c) there are very few sensible things an application can do while
> : resolving.
>
> Again, true for TelStar, but not true for CAB, See my earlier psot about
> being able to scroll around the currently loaded page.

True, but please note that I recognized the problem. I'm not in favour of
the current situation, but I can do very little about it, basically it's
the client authors who need to do something about it, which Howard has
demonstrated successfully.

>: I have a few things on TelStar's to-do list. I think I'll add a background

I wrote the above before learning that "Zmodem" on top of TCP was meant.
What I meant was that TCP/IP and Zmodem cannot coexist on the same line
(on the same networking level, if you wish), and you'll have a hard time
if you wanna disagree on that ;-)

I never had the need to look, let alone use, for this strange thing, so
I simply was not aware what was meant originally.

Maybe, sorry if I misunderstood you, but "I don't think this is too
dramatic a departure" sounds much like "It's ok by me.". But ok, so
you do not want to put it this way.

> PR> I guess you have never used mail in an environment where the line
> PR> length really matters.
>
> It has to be said, Peter, that too many people spend too much time caring
> about some vague possibility somewhere at the end of the rainbow.

I don't think so. The fact that people concerned with developing network
protocols care about distant possibilities is the one and only reason why
the today's Internet still provides interoperability to so vastly different
machines.

And for this reason I find it unbelievable that some people are arrogant
enough to think they can safely discard such carefully crafted protocols,
and invent their own.

> PR> That would be an acceptable compromise I suppose...
>
> Thank you for proving my point.

I only said "compromise" because it'll lead to other trouble (people will
ASCII-craft a table in the editor, and the reformatting will completely
destroy it). But at least this kind of trouble is obvious to everybody,
and cannot be ignored by some people who have an environment where no
problems crop up (like with the line length issue).

hyc@frisky.la.platsol.com (Howard Chu) writes:

> Ah, so you're a Zmodem protocol expert.

Not really. ;-) I just happen to know that it was specifically designed
for serial connections. This means the context is entirely different, so
IMHO one should do the community a favour and not confuse things by calling
"Zmodem-protocol over TCP" a true "Zmodem". I had an inquiry by someone
who read this thread, about putting it into TelStar, but the guy was afraid
if possibly a second phone connection was needed for it.

>>For the Amiga thing, this is abusing a Telnet connection for simulating a

Huh ? Telnet is designed for "simulating" a terminal, this has at first hand
nothing to do with serial links.

> Telnet itself is a virtual terminal protocol - and a terminal is
> implicitly a serial device. Where do you get these crazy notions of what
> is or isn't *allowed*?

I thought you'd read messages more careful. I have not used the word allowed,
nor "must" nor any other related word in my posting. I used the word "abuse",
in the sense of using something for a purpose it was not designed for. I
guess you've taken it far more negative that I meant it.

>
>Does anybody know why this is?

One possible cause of the problem: CAB doesn't seem to be able to handle long URLs (even if the OVL can). If you're using a search engine and refine the search etc (so the URL gets longer with all the additional search strings etc), sooner or later it dies. Old versions used to just crash, 2.5d (latest English version, AFAIK) suddenly starts writing all over the screen with the system font magnified dramatically, then it crashes!

Anyone know if later versions (eg 2.6, 2.7) do this too?

New at Systems For Tomorrow Feburary, 18th 1998
~~~~~~~~~~~~~~~~~~~~~~~~~~~

Link 97 for ST/STe/TT $89.99
Easly connect harddisks, CD ROM drives, streamers etc. to your DMA port. Technical features: SCSI 2 Commands (Harddisks above 1 GB can be used), Parity, SCSI Initator Identification (Harddisks like the Quantum Fireball series can be used), You can connect up to 7 SCSI devices. Note: Does not include driver software. From WB Systemtechnik.

DTP+G Desktop Publishing CD $39.99
A desktop publisher's dream! This CD contains over 3,600 fonts in Calamus, True Type, Postscript, GDOS, Signum, and other formats. It has over 8,000 pieces of clip art as well as DTP support programs, printer drivers, word processors, font editors, CAD software, printer utilities, and more. Over 90% of this CD is in English! It also includes four commercial packages: Family Roots I, DegasArt, Edith Pro, and X-Lator. From Floppyshop.

Atari Computing #7 $9.99
Reviews: CAB PPP-Connect, Geneva, ImageCopy, CENTurbo I, Magnum ST, Texel, Tetris II and More. Neuss 97 Show Report. C Compilers: Prospero vs Lattice. From the Atari Computing Group.

Papyrus 5.15 for TOS Computers $169.99
Papyrus is a powerful, easy-to-use word processor for all ST/STe/TT and Falcon computers. It makes extensive use of a comprehensive range of both text processing and DTP features, enabling you to create all kinds of professional looking documents. We also have Papyrus 5.15 Upgrades. From HiSoft.

Scan X: UMAX for TOS Computers $49.99
This new edition of the Scan X scanner drivers provides support for the UMAX Astra 1200s and VISTA S-12 scanners. A MicroTek E3/E6/35T+ version is also available. From Homa Systems.

RAM Gizmo /w 14MB for Falcon030 **SALE** $99.99
Wow! RAM prices sure have droped over the last couple years.. This is by far our best price ever. Under $100 (well a little) for a populated RAM Gizmo with 14MB RAM! Limited quantity available. From chroMAGIC.

HD Driver 7 for TOS Computers $49.99
Latest version of the best Hard Drive software you can get. Upgrades from v5 or v6 are available for $25. The return of your
~~~~~~~~~~~~~~~~~~~~~~~~~~~

manual and disk are required for the upgrade, Email for details.
From System Solutions.

CAB 2.5 /w PPP Connect for TOS Computers $49.99
The long awaited update to CAB is now shipping. CAB 2.5
includes several new features and Plug-Ins, plus it includes PPP
Connect, a TCPIP stack for MagiC, to allow easy internet WWW
access. From System Solutions. ** sold out again, new stocks
will be arriving soon **

Electronic Cow!
Three cool music applications! For more information check out
the Electronic Cow link on our web site!

MIDI Arpeggiator for TOS Computers $27.99
Sound Chip Synth for TOS Computers $19.99
Snippit Synth for TOS Computers $29.99

Also Available:
Atari Works $79.99 Easy to use home/office suite.
Lattice C 5.6 $139.99 C Compiler.
True Image $29.99 Image Processing Package.
Alien Thing (Expert) $19.99 Alien Blasting fun!
Tetris II $11.99 Cool Tetris game
Power Up $19.99 Racing fun for ST/STe/TT/Falcon
Desktop Solitaire $19.99 8 solitaire card games for TT/Falcon
Face Value $69.99 Visual style GFA programming
All Things Falcon CD $9.99 Tons of Falcon PD/Shareware on CD
Hard Disk Sentry $39.99 Optimize that Hard Drive
Photo Show Falcon $9.99 View Photo CD discs on the Falcon
Card File 4 $29.99 Personal Information Manager
Moving Pixels CD $29.99 Software Collection /w sources on CD
ESG Clipart CD $19.99 IMG, CVG and GEM/s clipart on CD
MIDI Maze $4.99 The classic happy face shooter!
True Paint $19.99 GEM based paint package
Plus about 400 additional products for your TOS Computer!

>monitor problem if I can get 1024*768 64K to display properly. This is
>on a Falcon with the latest VDI drivers.

Hi Mike,

Unless my new math skills are all shot, 24 bits is 16.7M colors, 16
bits is 65K colors and 15 bits is 32K colors (Falcon TC mode I seem to
remember ???). The 24 bit mode gives 1 byte of gray depth for each color
- 256x256x256=16.7M colors. 4 megs of VRam should be capable of handling 24
bit color at your highest resolution. One faulty memory chip could be
the cause your problem. My card only has 1 meg of ram and I can get 65K
at 800x600 and 16.7M at 600x480.

On a practical side however, few if any monitors can really display more
than 65K colors anyway, regardless what the manufactures say :).
And going from 65K to 16.7M colors really slows down the display refresh rate
without any real benifit on screen.

3400. What's a good monitor for Falcon030?

Newsgroup: comp.sys.atari.st
Date: 1998-02-17 00:00:00 UTC
From: fowler@u.arizona.edu
Message-ID: <6camuqjfg1@news.ccit.arizona.edu>

Hi!

>1. is there some information on www how to repair a
>Megafile disk?
There is an hypertext for ST-GUIDE, called 'chips' but its entirely in german...
Whats wrong with your megafile?

>Does someone knows where to buy/obtain such cards?
Most of these accelerator cards cause much problems, especially the HBS 640 series
because of overdriving the CPU chips used there.

The best accelerator card for Atari is the PAK and was released as a project in german
computer magazine c't. This fine thing of hardware is still available as a kit or
ready-to-use version. Just take a look at their home page: http://www.heise.de/ct/english

The boards are sold by subcompany eMedia but I didn't find any link on their page. Maybe
you have to contact them per email.

Sometimes the oler version PAK/2 is sold als used component in maus.biete (germany), it
uses an 68020. The actual version PAK/3 uses an 68030 and can speed up your ST up to 50Mhz!

The PAK is also available from mw electronic, a german company. I'm not sure if they have
a homepage in the web, i have to look for it.
But I can give you the adress:

MW Electronic
Heisterbacher Straï¿½e 96
D-53639 Kï¿½nigswinter

phone: 02223/1567
fax: 02223/26982

hope it helps...

Bye
Dietmar

Hi,

>For Cubase, I don't know for sure, but probably it is not compatible.
I think cubase should work, because since the TT was released it will for sure
work with big screens (Cubase 3.0).
You can ask steinberg directly, they should know about all the problems;-)

Bye

Dietmar

Hi Laurent,

>And forget to add an EIDE, because with Mega ST, there arn't such
>interface, and doesn't exist adapter IDE. The only Atari can accept IDE is
>the Falcon.
Sorry to correct you but there ARE several solutions to connect IDE drives to an st.
Even the falcon IDE interface was first introduced in the st book portable and needs
TOS 2.06.
I use the IDE Kit developed by german c't magazine in all my mega st computers for
internal hard disk only - even my MIDI-mega works fine with it.

But you are perfectly right - SCSI is much better and easyer to use - so I gave him
the same advice;-)

Hi Willam,

>can i put a regular ibm harddrive
>(eide) to the atari and what else might i need to do it?
There are 2 possibilities connecting a hard drive to your mega:

1. external hard disc drive via SCSI Host adaptor
2. internal hard disc (SCSI/IDE)

I never tried if the internal IDE kit for ST works with EIDE, but it works fine with IDE drives. You will have to do a litte soldering, TOS 2.06 and a IDE kit to connect a IDE drive
to your mega.

The 19 pin sub D connector on the back side of your mega st is the dma port, a subset version
of the standard SCSI interface. All you have to do here is to buy a host adaptor, some cables,
a case and at least a hard disk with scsi interface.
You can buy a host adaptor right there: http://members.aol.com/wbsystem (its a german page!)
The main advantage of such a host adaptor is the capability to adress up to 8 SCSI devices such
as hard discs, zip drives, cdrom, pd drives, streamers, scanners etc.
With IDE you can only adress 2 devices and there is no possibility to hook an external IDE drive on a st!

So I strongly recommend a SCSI host adaptor - its the better and easier way.

Bye
Dietmar

Peter Rottengatter (perot@suse.modem.stud.uni-hannover.de) wrote:
:
: > And I thought if STiNG did
: > this fabulously nifty trick, rather than depending on the author of the
: > CAB.OVL to do it,
:
: What do you think the resolve() should return to the caller in that case
: (while the resolve action is still going on) ? Should it return resolve
: successful (and which IP address to return then), or should it return
: resolve failed ?

No, you're right, the problem has to be attacked from both ends. What I was thinking was that the API could be extended a bit to include a resolve() acknowledgement that would basically tell the STiNG dependant application that the resolve is in process and to check back again next cycle to see the outcome. So, in this case, the CAB.OVL would have to be updated to support this new resolve() response. But still, it would keep the work of doing the resolve in the background in STiNG. Hopefully this new resolve() response wouldn't break the backward compatability, it would be a shame if programs written for the old API got too confused by the new resolve() response. But my understanding is you are thinking of ways to expand the API, and this is my suggestion for one way.

I suppose CAB may be confused by the CAB.OVL constantly putting it off too, and so require some modification as well.

: Sure, the resolve call could be split into separate functions such that
: program flow control is returned to the application again and again until
: the resolve is finished. But that's a completely different way of doing
: the resolve, and parts of each application had to be rewritten to use it
: (which is a very unlikely thing to happen).

Yes, that's it. You've got it now. Well, as I said at the beginning of all this, it would require supporting code in all the programs. That's why I was anxious to see this idea floated while all the major STiNG supporting programs are still in active development. But the main thing was to try to come up with something that would solve the problem no matter the OS, so as not to rely on MiNT threads of Magic threads (or whatever you want to call them), or anything like that.

: a) a resolve seldom takes longer than a couple of seconds

As you were talking about TelStar at this point, your comment is fair enough, as the resolve only happens once per session, usually. But in the case of CAB, where it happens each time you visit a page on a new server (which means, possibly with every link you click on, although some links

will be on the same server as a page already visited), it gets to be rather annoying, espacially when the resolve is, for whatever reason, acting sluggish (as it was for me lately).

: b) it does not affect any other application on the machine

I haven't been fast enough on the mosue to try this with TelStar, but, again, with CAB this is not true. Once the resolve seizes up, I am forced to stare at the screen for two or so minutes, now mouse action or keyboard action is interpreted, I can not switch to another running application.

: c) there are very few sensible things an application can do while
: resolving.

Again, true for TelStar, but not true for CAB, See my earlier psot about being able to scroll around the currently loaded page.

: I have a few things on TelStar's to-do list. I think I'll add a background
: resolve, just to study what kind of effort is involved to do this. I do not
: expect it being exceedingly difficult though. Guess I should make that bit
: of code available so that every client author can put it into his/her client.

Your plan to possibly use TelStar as a testbed for a background resolver is exactly why I brought TelStar into this discussion. If you can get it to work with your own test program, then Dan and Alexander would probably be able to make use of that knowledge in their parts of the puzzle to make CAB able to resolve in the background as well. I'm happy to hear you don't expect it to be very difficult. I was truly hoping this would be the case. The less difficult it proves to be, the faster we will see the results of this discussion in the form of improved software on each of are hard drives ;-)

: Not sure what you're talking about. The bugfixes I mentioned recently are
: on my web page already (download MODULE.LZH).

Yes, it's just I forget whether I have the versions from the end of January on my system now, or the ones from earlier that month, so I plan to download the ones from your page and install them to assure I am using the very latest.

: Cheers Peter

And to you mate...

:
: You'll need NVDI 4.x to print images.

Well, that's more informative than the Systems Solution manual. I wish they had just said "Requires NVDI 4.0 or above of SpeedoGDOS 5.7 and above" (or whatever the version numbers exactly are.

But I'm still curious as to what has changed between earlier versions of CAB, which _could_ print graphics with my older version of NVDI, and current versions of CAB which are going to require me spending $70 (more than CAB costs, actually) in order to restore this functionality.
I'm sure Alexander had his reasons for this change, he has demonstrated a history of trying to be as broadly compatable as possible. But I am curious.

Ask BEST ELECTRONICS for the relacement pwr supply. Shouldn't be too dear.

The most reliable upgrade for a Mega ST is the ICD AdSpeed 16mHz board from Tom Harker's outfit in Illinois. They are really hard to find now, but maybe someone has one to sell you. Make sure you get all the software with it for the caching, etc.

Also get a Beetle Mouse (or a Golden Image mouse if you can find one) and combine it with Atari's freeware MACCEL.PRG. The whole computer feels faster with those 2 installed together.

There are other options as well: the PaK30 board is nice but expensive, still current and supported AFAIK: from ASH in Germany. Fly at 40 mHz on that one, add MagiC and go even faster.

The jury is still out on PaK30 compatibility with CUBASE and NOTATOR, if you want to use MIDI with your Mega.

Enough already.

Yes, you are right, I didn't have to say it again ! Sorry !

>My problem is more like that:
>Did you ever try to handle a 40MB truecolor TIF on TT030 and wait for
>`undo`?

Well for the moment it's quite impossible for me to load a 40Mb truecolor
TIF and I will go even further: why are you trying to use such big picture
files ? If you are a pro of the Layout I suggest you could use a Hades or
something like a very fast Macintosh ... I really don't think people here
have one day tried to load a 40Mb truecolor TIF in their TT ... for sure
trying to do that is loosing time with a TT.

>Every standard coffeemachine can boil enough coffee for 4 persons during
>that time:-)

Coffee is not my cup of tee but yes you are absolutely right !

>so what will happen if you take a 128MB TIF and wait.....?

Well, if TT owners plan to buy the new AixTT 256 Mb memeory card, I suppose
they will not use it for that ... but rather to load a big Calamus doc
which contains let's say 300 hundreds pictures of any kind ...

>CU Frank
>

There are very few games that run in monochrome. If you are mainly interested
in playing games, you'll probably be better off connecting the ST to your TV.

Cheers,

Nick.

>.

I don't really notice any speed difference between 800*600 16bit or
24bit, but then I have the NOVA ontop of an Afterburner 040 running
40Mhz:). I remember Doug Little saying that 32bit mode should be the
fastest display because of the way it works (real technical, right:).
I have tried Photoline in 32bit mode, but the display is not right. I
did however notice that when scanning, (GT Look only recognizes 15 bit
mode) that scanning in at 24bit mode showed dithering that doesn't apear
in a 24bit display.
I guess I'll have to pull the card and put it into a PC to check the
memory with the ATI utilites disk (that I so thoughtfully kept when
selling the ATI VLB card:).

Thanks,

Mike

Yes, it's an awfull thing using a scanner, I have now one and really,
for net use I only scan at 75 dpi, so I obtain the same size as
original and not too much memeory use ... Nevertheless for layout use
I'm not yet an expert ... I need some information to avoid some bad
dithering or so ... which is the best scan resolution to use with
color or grey levels and how much can we reduce the original ...
things like that ...

>JV>Coffee is not my cup of tee

>JV>buy a new TT RAM card
>AixiTT256??;-)

Yes, I think so ... only if it supports new EDO ram because the normal
simms are not easy to find today ... but I think it will support such
memeory kind because for their Mega STE memory expansion, it already
was the case :)

there is an article in the french ST Magazine about Cubase running perfectly
on a Hades machine. There is also a snapshot, and it looks like it is in at
least 1024x800.

Cheers,

Nick.

Oh, never mind. It's just that one of the first music programs I ran on my ST years ago was a certain Noisetracker player... That was also my first encounter with a scroller. :)

: > Pentium 75 running Linux). Would have to use the DSP...
: Well, can't help you on that, haven't got a Falcon and never
: did anything with a DSP.

I just printed out some 160 pages containing the DSP instruction set from the original PDF Motorola manual. Anyone interested in this cut-down Postscript version of the Manual?

: Can do some math but, I think, you too.

Yep. And I borrowed a massive Computer Graphics bible from a friend. Only problem is reading it, as the first page alone is enough to give one a rather large headache... :-)

Yeah, I can tell you that there are at least two other ATARIans that behave the
same way. :-(

> I guess you're talking about some other programs than "Start me up setup"
> because it's freeware.

I didn't know that. I thought that you need a key for SMU-setup.

I knew that SMU is freeware but SMU's author is very reliable anyway. :-)

Its 95% PC stuff! Anyone ever heard of an Atari guitar tuning program?
It would come in handy with all the new tunings in use these days.
That song "Touch Peel Stand" is a bitch to play without a weird tuning that a
standard tuner can't do.

> There are hundreds of programs for making music and listening
> to music which you can download at
> http://www.hitsquad.com/smm/atari/

Its kinda weird the way these pages are organized. While on an Atari page you
scroll down and find yourself looking at PC stuff.

> There is mainly ST software but there's also some for the
> Falcon.

Not to complain about a new site that features Atari stuff, but it only has
about 15% of Atari music PD/SW stuff that I know about. I would upload some
stuff but I can't send anything beyond my ISP's server.

There were an extremely wacky problem with NVDI and Cubase on the AB040.
You had to run NVDI in ST-RAM! I'm not sure if this has got anything to
do with your problem, but give it a try. Set the program flags in NVDI
to
only use ST-RAM.

Magnus Kollberg , <magnus.kollberg**@**emw.ericsson.se> a ecrit :
>>
>>What is NOVACAL? Where can I get it?

NOVACAL is a program to place in AUTO folder in order to use Calamus
on graphic cards when using more than 256 colors. I got it with my
Hades/ET4000, and because of it's name I think it's more suited for use with
NOVA cards, but I can't guarantee.
I don't know at all if it is freeware or not ; I'll check if it is
sold with standard SL package and reread the doc if I find it again... I know
some programs for falcon graphic modes comme with SL 96.
If you want to try it, send me a mail and I can send you the program
back (if it is really freeware, which I think).

Well I don't use Calamus my self, I was just qurious what it did and if
it
was Calamus only. Sounds like it is. Oh, I have got a Nova card.

3434. Nemesis and Ram Gizmo ;(

Newsgroup: comp.sys.atari.st
Date: 1998-02-18 00:00:00 UTC
From: thechyld@pcc-uky.campus.mci.net
Message-ID: <6cf6tasuk1@news.campus.mci.net>
Source record: 107303

Okay, I sincerely hope this helps future Nemesis/Falcon owners and that you can benefit from my bad luck...

Some of you have probably read my posts concerning the use of Chro-MagiCs Ram Gizmo memory board with the Nemesis accelerator for the Falcon 030. I had been running 4 4-meg, 30-pin SIMMs rated at 70ns, and was having video problems (artifacting, programs crashing, etc,...). E-mails from Titan Design said that they hadn't found a memory board for the Falcon that uses 30-pin SIMMs that was compatible with Nemesis yet. They recommend a board that uses 72-pin SIMMs (even EDO) rated at 60ns. Several other Ram Gizmo Nemesis users had posted messages saying that 60ns and 70ns SIMMs worked okay for them. Today, I bought 4 brand new 60ns (remember, I was running 70ns before), and tried them. It made no difference whatsoever. All I can say to you Nemesis/Ram Gizmo owners who have no problems, is that you must be lucky, and I must not be.

Anyways, if you've got (or going to get a Falcon) and you add memory, and you even remotely think you might get a Nemesis accelerator, then by all means get a Ram board that uses 72-pin SIMMs at 60ns...and stay away from the Ram Gizmo...If however, you don't think you'll ever, ever upgrade, then the $99.00 price for the populated Ram Gizmo board is a deal... ;(

disgusted...

3445. Re: Tons of Atari music software to download...

Newsgroup: comp.sys.atari.st
Date: 1998-02-18 00:00:00 UTC
From: greg_evans@delphi.com
Message-ID: <hrdGuzW.greg_evans@delphi.com>
Source record: 107314

I didn't notice the % of Atari vs. PC software but I had plenty of
problems downloading. For some reason the link doesn't take you right
to the file, but gets you to the FTP server at the top level. Then
you have to make your way down to the file. When I tried downloading,
several times, I got caught in a loop of starting the transfer, stopping and
starting
again.

Greg

3446. AUCTION: SC1224, SM124, and Software #1

Newsgroup: comp.sys.atari.st
Date: 1998-02-18 00:00:00 UTC
From: Rob Busam <sirosis@u.washington.edu>
Message-ID: <Pine.A41.3.96a.980218155837.73308A-100000@dante06.u.washington.edu>
Source record: 107315

If anyone would like the updates e-mailed to them let me know.

RULES OF THE AUCTION

1. Minimum increment to bid is $1.00.
2. All items will be shipped via USPS or UPS. Postage is additional as
is insurance if desired. I will give shipping costs within 48 hours
if you are the winning bidder.
3. Items will be shipped with in 24 hours of receiving funds (cashiers
check or money order) or as soon as the check clears if personal check is
used (allow about 10 days for this). No CODS.
4. Please pay close attention to your bids. Because of the size of this
auction it is very easy for me to make a mistake or an omission.
5. I will use the Going, Goingx2, Gone method. This process will begin
Monday, Feb 23, 1998. Every 72 hours will advance the status if I
do not receive any higher bids for the item.
6. I expect everyone to honor their bids once things are at the GOINGx2
or GONE stage. If you don't want an item, PLEASE let me know before this.
7. Buyouts are accepted.
8. The person making the earliest bid settles identical bids.
9. Each update will have the top 3 bidders listed.
10. Please list a name and item number when bidding.
11. Minimum bids listed where applicable.
12. No shoes, no shirt, no service.
13. Smoking allowed.

No your're right. TT-RAM is Fast-RAM. I prefer the latter term, because
TT-RAM in a Falcon is a weird thing, isn't it ?

> What I checked is what all the MagiC stuff does, and all PRG's, APP.s have from

> MagiC!

I doubt that the flags of MAGXBOOT are of any significance. There is the
possibility that it uses Mxalloc to explicitly specify where to load MagiC.
Even more, MAGXBOOT does not really need to use M(x)alloc at all. I guess
it simply chooses some good location, and loads MagiC there, regardless what
was there before. This is ok, since the MAGXBOOT will reset after this anyway.

In article <34ea4eed.0@athena.netset.com>,
baldrick@dilbert.netset.com (Dan Ackerman) writes:

> I could put my own resolve code into my CAB.OVL and have non
> blocking resolves. But this would require further memory usage for the
> OVL, a reduplication of what's already in the stack. This was the reason
> I had played around with g_resolve in STiK. A gem client using g_resolve
> does not block.

I definitely think Howard has not duplicated resolver code in CAB.OVL. Maybe he should clear this up. My understanding of what he and others said is that Howard used the gethostbyname() call, which is the BSD counterpart of the resolve() call in STiK / STinG. The difference is that he used a parallel running process to execute the resolver call, leaving full control to CAB. The same thing can be done with STiK or STinG of course, provided some multi-tasking environment like MiNT or MagiC is present. This does not require any resolver code in the OVL.

> So unless everyone considers it obscene that I haven't put my own

"obscene" is a bit strong language for this, isn't it ? ;-)

I think the current situation is fairly alright. But people always aim for luxury, and you can't deny that non-blocking resolves is a convenient thing to have.

> for blocking on resolves. It's a limitation of the TCPIP stack it is
> running and the calls it is using. If you want to blame the CAB.OVL you
> should blame every STiK/STiNG client out there. They are all deficient in
> this respect. As far as I know the only 2 client authors that have played
> with a full resolve code for STiK/STiNG are myself and Peter. So since
> we both failed to put that code into our clients we are both as fully

The solution Howard chose (AFAIK of course) is just a bit unfamiliar to both of us I suppose, while Howard programs Unix for decades (or at least it seems so :-)) which makes the method of employing another process a fairly obvious thing to do. STiK / STinG client programmers all come from the single-TOS world, even though most use MiNT or MagiC nowadays.

I believe this employing another process is easy to do, once one has mastered the basics. What do you think about a little collaboration : I build parallel resolving into TelStar, and send you the code, so that you can integrate it into CAB.OVL ?

Cheers Peter

Hi Jo
JV>I only scan at 75 dpi
...might be a bit less than normal screen shows 1:1, I always though it's about 90 if you don't want to give any more pixels than absolutely nessesary.
Maybe it differs from screen to screen...

JV>I need some information to avoid some bad dithering or so ...
what kind of? Missing evidently needed colors, conversion into false onces,
strange line...there are as many ways to go wrong as there are to go at all;-)
I'm not an expert of dithering, but I know it always depends on the things you are hitting at. Normally you better scan in highest resolution under highest depth of color to prepare dithering and have best control over it. Lateron you can small down according to the media you will use the product for. (for color and greyscale)
I leave it to a soft called Graftool most of the time, doing it quite well for screen things. But theres no wysiwthg;-) because therefore you have to keep available all browsers and screens use by them;-) I made my dissapointing experiences with some little animation-gifs looking smooth and good on my screen (1120*880*256 not very quick response) but made horrible flickershows under Netscape on a 800*600*256 PC-screen. DIY and get wise;-)

JV>understand it's just mine.
won't steal it :->

JV>Yes, I think so ...
good luck!

JV>simms are not easy to find today ..
...I've got my 4*16MBs right in time:-)

Hi Magnus
MK>Does MagiC only execute those files found autoexec.bat and ignores all
MK>other programs even if they are executable e.g. have the extension
MK>*.PRG?
yes. yes. until next coldboot.
If you talk about the AUTO-folder. START-folder APP/PRGs will be executed
as normal. Funny gimmick, I first didn't see its value but it really fine
kicking AUTO off its throne;-)

I found out another good tool to configure bootprocesses still remains
Xboot:
if you write f.e. 'bad.prg' into your AUTOEXEC.BAT and Xboot changes it
into 'bad.prx` it won't be booted under MagiC as well, just because
'bad.prg' is not found...(ease way to test programs that could hang up
system and kick'em out before they could do it again)

And you can give MagiC pathes other than AUTO to find its autoprograms,
I've got one AUTOMAGX folder with programs never needed under TOS or
MinT/N-AES

All I didn't like in the end is its NAME, I patched it in my personal
Magic.RAM to 'AUTOMAGX.BAT' ;-)

Hey
[The Following is but my 2 cents, not much more. As a starving musician, I can't afford much else]

Well, I've seen this Hotz Box for years now (I've talked to Jimmy Hotz on many occasions). As of Nov. '97 there is supposed to be a PC version of the software available. Mr. Hotz was showing a demo of the new software at a conference I attend. The software actually appears to be quite dandy. It is much like a arppegiator for scales (in an odd sort of way). He is supposed to be adding rhythm patterns to its bank in conjunction with its bank of scales (supposedly the single largest coagulation of scales in one place). It seems like it would be quite useful for someone who doesn't have the time, or skill, to learn all of those esoteric scale and chord structures (it has all of those middle eastern and Semitic scales that I won't even pretend to talk intelligently about).

If you want, I can go and find out the Hotz web page. There is supposed to be (as I recall, don't hold me up to it) a demo of the software.

Hope all is going well!

DG> on my Falcon and it worked without any tweaking at all.

Hi Dave,

I must state this slightly different:
This is on a TT 4/16 with TOS 3.06
When I first installed MagiC on my J-partition, I could use Selectric with it.
Recently I got the NVDI for my Matrix and decided to create a new boot config
on my C partition, so I first installed the latest Matrix software, then the
NVDI and then added MagiC. Of course I tried to replace the Magxdesk filesel by
Selectric again, but it simply refused. (To be more specific, I didn't copy the
MagiC stuff from J to C, but re-installed MagiC on C!). Come to think of it, it
might have to do with NVDI...

>> Boxkite will and Freedom will.
>> I got hooked to Freedom in the meantime and can recommend it highly.
DG>
DG> I'm getting ready to try Freedom right now :-)

You definitely should and I bet you won't want another one afterwards :-)

Hi Alan!

a> Organization: Retired? Ha!
a>
a> Can anyone tell me of a source for NVDI 4 printer drivers? I'm
a> looking for something which is compatible with a HP DeskJet 660C.

You're in luck, NVDI V1.12 (upgrade available from System Solutions) has a driver for the HP660C.

Alternatively you can edit the present Deskjet driver to add 600dpi B&W resolution by copying printer codes from one of the Laserjet (forget which) drivers. The "official" driver has 600dpi greyscale print capability.

Speak to 'ya later!

I've had so many requests for Telnet via my BBS that its not even funny.
Can anyone tell me exactly what software/hardware/steps I would have to
have/implement to achieve this goal? I'm currently using the following:

BBS Express! ST v1.98a (latest)
Mega ST4 (TOS 1.4, Adspeed@16mhz)
2 Pioneer CD-ROM 6-packs
Seagate 4.5 Gig HD
Sysquest EZ-135 removable
Supra 28.8 Express (only 19.2 used-but I'm willing
to install the RSVE board as well
as an another phone line if needed)

Thanks in advance for any info! ;-)

3464. Spectra GCR question

Newsgroup: comp.sys.atari.st
Date: 1998-02-18 00:00:00 UTC
From: gwestndrf@aol.com
Message-ID: <19980218004801.TAA16825@ladder02.news.aol.com>
Source record: 107382

I recently bought a Spectra GCR cartridge so that I could experiment/learn more about the Macintosh computer and operating system. As AOL is my only option for access to 'cyberspace', I am interested in downloading some of the MAC software from AOL's library. I can get to the files with my 'pc', but I haven't been able to figure out how to preserve the MAC binary format. I had hoped that an older version of AOL could be used to download them directly using the Spectra system.

My problem is that the oldest AOL MAC version I can get is 2.51 which requires System 6.07 and 4 Mb of RAM. I only have System 6.05 and might also be short on memory because my STE only has 4 Mb of RAM to start with.

I'm hoping someone can help me with answers to a couple of questions.

1) Is there a way to download the MAC files with a Win95 box to an IBM format such that I can use Transverter on my STe to convert them to MAC format?

2) If I get System 6.07, will AOL work with the Spectra system?

Any help is appreciated.

Thanks,
Gail

Really? I have VideoMaster Falcon and it works from fast ram on the
Mighty Sonic card (32mb) I never tried the ST/TT Videomaster on my TT.
I haven't tried the Falcon version on the A/B (yet:).

Yes, Nima sent me my registered version of M_PLAYER. This is a really
cool movie maker. Fast too.

>CAB.OVL
>and Howard apparently has done a good job on supporting this.
>Unfortunately,
>CAB.OVL for STiK/STinG does not support it.

This is a somewhat ludicrous argument that's been going on here.

Let's look at the components.

1. CAB.OVL for MiNT Net does not block while resolving.

2. CAB.OVL for STiK/STiNG blocks while resolving.

Where are the differences...

Hmmm... CAB.OVL for MiNT Net does internal resolving.

CAB.OVL for STiK/STiNG uses an external call in the TCPIP stack
for resolving.

I could put my own resolve code into my CAB.OVL and have non
blocking resolves. But this would require further memory usage for the
OVL, a reduplication of what's already in the stack. This was the reason
I had played around with g_resolve in STiK. A gem client using g_resolve
does not block.

So unless everyone considers it obscene that I haven't put my own
resolve code into my CAB.OVL. I don't think the CAB.OVL should be blamed
for blocking on resolves. It's a limitation of the TCPIP stack it is
running and the calls it is using. If you want to blame the CAB.OVL you
should blame every STiK/STiNG client out there. They are all deficient in
this respect. As far as I know the only 2 client authors that have played
with a full resolve code for STiK/STiNG are myself and Peter. So since
we both failed to put that code into our clients we are both as fully
responsible as anyother client author. If we are going to live in a world
where it's the client and not the call that are to blame
```

:-)
Yes, no names, because one of them replied to one of my emails and I want to give him the opportunity to answer once again.

> Are you talking about programmers who have left the Atari scene and don't
> want to release their software for the public, or something else?

I am talking about a current soft/hardware-combination they sell but don't deliver.

> >> I guess you're talking about some other programs than "Start me up setup"
> >> because it's freeware.
> >I didn't know that. I thought that you need a key for SMU-setup.
> Yes, you do!

>You talked about people getting ripped off which isn't exactly
>the case here,

Oh, perhaps it was a little bit confusing.

What I want to tell was that the author of SMU-setup ripped people off when they sent him things in advance.

And then he ripped them off in another case.

So it seems that it is a general behaviour of him.

> I surely don't understand why he won't release the key or reply to any email
> concerning the subject.

Perhaps he doesn't have an account that is valid?

> >I knew that SMU is freeware but SMU's author is very reliable anyway. :-)
> You mean _isn't_ reliable? Have you also had other experiences with him?

No, I meant reliable.

SMU and SMU-setup are two different programs from two different people.
Don't mix them up.

The author of SMU (Thomas Much) is very reliable.

Tschuess,
Frank

: Thanks for any responces.

One thing the Atari world HAS had is a multitude of quality word processing programs. I must admit that I thought that Atari Works was one of the, shall we say, least good! (Although the RTF export is very useful).

I would suggest a choice of:

Protext for reliability and speed - although it will not multitask (under Geneva anyway), does not use 'normal' GEM menus and relies upon printer fonts rather than generating graphical output (which is becoming a limiting factor these days as Windoze has taken over where we used to have a choice of fonts in the printer). Protext converts to/from RTF.

Or

Papyrus for a powerful GEM-based package. I'm sure it will handle RTF too(?).

This happens only because CAB writes the URL into info line of
the window. Unfortunately the AES (of MagiC) does not allow
such long texts. But instead of truncating the text it does
overwrite some internal structures. This is why you'll see
these big fonts. Now CAB truncates the text itself.
IMHO this is a bug in MagiC.

Hi there!

If all you're looking for is transferring PC text files, have
you tried RTF format? I've used it to go from Atari Works to Word, and
it works great! Otherwise, I've heard Papyrus is pretty good, too.

Does anyone know what the currently available 'Atari Emulators' for use on the Apple platform are ?

If so - will they run on the new 'GE' series of Apple 'Power PC' products - reputedly 'optimised for Mac OS' - and are they happy with OS 8 ???

Hi!.

I use Papyrus in may falcon and I'm very happy with it. Is full
WYSIWYG, can deal with a lot of graphic formats to insert into your texts,
uses unicode, it is fast, the user interface is just great and I haven't
experienced a single crash in two years. For export/import it has RTF,
that is very customizable in v5, so no problem to use the same file on Pc
or any computer that understands RTF. When used with NVDI, you can get the
very same TrueType fonts as in the computer you are exporting to, so the
doc will look the same and print out the same.
You can get a very usable demo of pap v5 from the system solutions
in england (I don't recall the URL, sorry). Is not cheap but for serious
use it really worth the investment.

Regards.

Daniel.

Have you tried the MagicMac Demo available from either the ASH website, or Toad's Atari Central website? I know MagicMac is rather expensive, but it's VERY fast, and should work on PPC and OS8, as far as I know. Download it and give it a try! Otherwise, I've heard of one newer emulator, but I don't know how good it is, and what it will run on.

Greetings,

Can anyone tell me if there is any driver software around for an IDE CDROM to combine with HD Driver 7's abillity to control 2 IDE devices?

Also, as I already have the CDROM drive(PC surplus), would the Falcon PSU be able to power the CDROM via a power splitter cable from the internal HD power line?

If these are dumb questions (I've got thousands of 'em!) please forgive my ignorance if not TIA for any advice.

Cheers.

I don't know how much Atari stock Toad still has, but you can e-mail them at info@toad.net about the Beetle Mouse. Otherwise, pretty much any Atari dealer should be able to sell you or order you a mouse. I know Systems For Tomorrow has some different styles, too. Go to http://www.SystemsForTomorrow.com/ to see what they have and/or get one of their catalogs.

No probs to reach his URL today (19u30 MET-1). Only it was so damned
slow. It took me about 8 minutes and I had to press 4 times the <ESC>
buttom before I finally reached the above mentioned URL.
Downloading the firecall.lzh was however impossible. It seems that the
link doesn't exist on the server.

ftp sys files for 6.07 from ftp.info.apple.com
try RAM Doubler

> I'm hoping someone can help me with answers to a couple of questions.
> 1) Is there a way to download the MAC files with a Win95 box to an IBM format
> such that I can use Transverter on my STe to convert them to MAC format?

not neccessary to use transvertor(though you can if you want! :). get a
mac program
that will read PC disks. forget the names but they are around. then just
place
your PC disk in the Spectre(Atari)Floppy drive. if your are talking
about long
file name support, this should work.

> 2) If I get System 6.07, will AOL work with the Spectra system?

i don't know as i've never had aol. try it! what have you got to lose?
if aol 2.51 works with sys 6.07, and you have 6.07 running, then 2.51
should work
and you are online. personally i'd rather use CAB.

> You just need the right harware to display them on. ;-)

Choose :

* A 12 MHz 520 ST+ with SM 124 (resolution 960x544 monochrome) using
CAB.

* A Pentium 133 (64 MB) with Matrox Millennium (1280 x 1024 TrueColor)
on an Eizo F56, using Netscape on Linux.

Which one is the right hardware ? With both it gave me white pages.

> Maybe not in the respect as you said above, but from a design point of view they

Hmm. Indeed I find it more important that the pages are readable, than that
they show a great design. Certainly I'd call unreadable pages a bad design
anyway. Sorry for my pages then, as most likely you'll say that they have
no design either.

Cheers Peter

>> to achieve their goals.
>
> Ehhh????? I know many programmers who uses those.

What ? Dirty tricks ? Bad enough. Or do you mean Freedom, thinking it's
okay what it does ? Things like accessing other application's windows ?

> I guess you must be rare
> who dislikes everything which doesn't do things the "proper" way. If the system
> has limitations, people will come up with hacks.

Hacks that generally fail badly eventually. Things usually are not
specified in a certain way to annoy programmers, but to ensure compati-
bility with later versions, and clones that stick to the specs.

At the time I tried Freedom, I did some experimental work on a window
manager. I didn't get very far, but I had a primitive windowing system
running. This window manager would return window handles (wind_create())
on a per process basis, i.e. often there were several windows with handle
zero, essentially each process could have one, as the handles only had
to be unique within it's process environment. This is 100 % conforming
with specs, and all programs worked, just Freedom screwed it up badly.
This was due to the dirty tricks it used.

I don't care if you like Freedom. I guess you do, and who am I to tell
you to not use it. But I don't, and I'll proceed telling people that
Freedom is what we germans call a "Schweineprogramm", and that one should
be prepared to expect the worst from it, 'cos if the programmer has been
reckless enough to ignore such obvious specs, he might as well ignore
anything.

> If MagiC or any other OS
> removed this limitation noone would need them but as it is now TOS/MagiC does
> have limitation. If they didn't, these programs would not have exsisted in the
> first place.

I'm not against overcoming limitations, after all this is what programming
is all about. But there are limitations to the methods that should be employed.
Concerning hard-iconify, implement it in such a way that no program that
deals with windows in a way conforming to GEM specs can tell the difference
if your code is there or not. If you achieve this, I'd say nothing against
it, and might even use it. The only thing I did here was saying that I doubt
that it can be done.

> I guess only those who writes TCP/IP stacks and can point out 10 bugs in TOS
> are programmers. Those who programs just for the fun of it are just lamers I
> guess.

It's been you who said that. I won't even think such immature statements.

> The discusion was if it was possible to do it or not. _Not_ if it's legeal
> or not, as any braindead 4 year old would understand that it's against the
> "rules".

As it's so easy to break the rules, isn't it ? ;-)

When I do programming, I consider only legal ways for exploring if
something is possible. If I would not do that, you'd never succeed
running STinG on your Falcon, it would run on STs and Mega STEs only.
If Alexander Clauss did not do this, you won't have CAB on your Falcon
today.

Go ahead. Do your hack. I guess you'd spread it too. Eventually there
will be some program stalling badly on it, and the poor programmer
will be blamed for it :-(

> You still have not proved that it could not be done, even if it's against
> every "paradigm" in GEM/AES whatever you want. I could very well be wrong
> but so far you have not showed it.

You misunderstood. I have never said that it's impossible if one
ignores the rules. However, your hack will never run with my window
manager that I mentioned above, simply *because* it's against the
rules. The very rule that you violate in that hack is precisely the
one that 100 % legalizes my choice of allocating window handles on
per process basis.

About 300 kB ?

If you run it from Fast-RAM, then I'm a bit puzzled why you would see such a
bad slowdown.

BTW: I doubt that the MAGXBOOT would observe those flags. The flags are
interpreted by the OS, when Malloc is called. However, for MAGXBOOT there
is no reason to call Malloc at all.

>> is far too complex to make any judgements without a full understanding what's

> So you are now saying the MagiC can't run from Fast-RAM?

No, I'm not. I was only pointing out a possibility. Apparently the
possibility does not exist anyway :

Your understanding is basically correct. Of course, the gethostbyname call
is implemented in a library that is linked into my CAB.OVL binary; it's not
an intrinsic system function like the STiK API provides. But I guess the
point is no, I didn't have to write any custom resolver code. Everything is
done with plain library calls that have been available to MiNT for ages...

>> for blocking on resolves. It's a limitation of the TCPIP stack it is

Well, I have always made my complete source code available, there's no reason
for you to guess about how it works if you're actually interested in finding
out. (Although, I suppose the code has few enough comments that you may still
be guessing from time to time, but nothing serious...) My only comment at this
point is - why go through all this trouble? I understand why STiK was written -
to give people something easy to use, without requiring them to install a
multi-tasking kernel on their machines. If you're going to use multi-tasking
anyway, then STiK and STiNG's primary reason for existing is nullified. (And

people who insist on single-tasking - well, that's just plain foolish. Besides, even unmodified TOS does multi-tasking, in a limited fashion, with desk accessories...)

>I believe this employing another process is easy to do, once one has mastered
>the basics. What do you think about a little collaboration : I build parallel
>resolving into TelStar, and send you the code, so that you can integrate it
>into CAB.OVL ?

Everything is easier if you have a model to follow. Download my OVL from my web site: http://highlandsun.com/hyc/. Obviously the process control will be very MiNT-specific; I've never used MagiC. The complete interprocess control/ communication scheme uses several mechanisms - AES messages, MiNT pipes, MiNT signals, and setjmp/longjmp. All of this (except for AES) is standard Unix programming approach. Note that the current OVL allows two processes to cooperate; this is not the same as a fully multi-threaded system, and my code will not work for general multi-threaded use. (But it's not a great leap to get it there...)

Yes you are correct. The cable was designed for SIO communication to the
PC I beleive that is is used for an 8-bit emulator

> can and thanks again! ;-)

It mainly depends on HOW you want it. If the telnet is supposed to look and
feel like the BBS over phone, there is no way apart from coding the telnet
server INTO the BBS binary (the program you launch to start up the BBS).

I have a Telnet server in the works, it's on low priority ATM however. If
you install that server, and have a permanent Internet connection, people
can log in at any time across the Internet. They'll get a command prompt
after login, and they can execute commands, which you provide by placing
the corresponding binaries into certain directories. This way you can
easily build a telnet based command prompt environment for your BBS.

Cheers Peter

Ok, sure, in this sense every MiNTnet client brings it's own resolver code.
But that does not mean that Howard bothered to write gethostbyname() anew
in order to make it "multitaskingfriendly".

As I said, only Howard, or someone with intimate insight into his code can
really answer this.

>> and cut off the wire close to the battery.

You don't need to put 3 or even 4 AA penlight batteries, two of them
will perfectly do the job ... they are now in my TT since 1.5 year ago
and I have just put the same package in another TT ...
No problem with the clock :)

>That's what I did too. The alkalines don't work as long as the right
>battery though.

We will see, before doing the transformation I bought one from
Bestelectronics and this died pretty fast, quicker than mine 2 AA ...
they are still fonctional !

I suppose Peter will jump on in on this, but I heard that HSModem was needed
for STING. HSMODEM has nothing to do with the MODEM.ACC that SERIAL.CPX
replaces. Those are two different things. Can you confirm Peter ?

Cheers,
Nick

For reasons beyond my control, I cannot seem to get any EMAIL MESSAGES
PAST FEBRUARY 15th. If you have sent me something, I am not ignoring you
I just haven't gotten it.

The mailserver continues to resend me my email from that day, and I cannot
delete it. I am getting error messages that say "bad handle" in NEWsies
Log. I am also getting EOF from remote server when NEWsie tries to delete
the files. Also any messages after FEB 15 come up with zero bytes, no
subject and the EOF error. However some messages after this date have arrived
containing the same messages in a single file. As some of these files are
over 1 meg it gets pretty ugly on my tiny harddrive. I cannot delete these
either.

I can send email however.

So, until my IP starts talking to me, I am in the dark.

Gee, do I need to say they just changed their setup on FEB 16.;-).

Yikes! the dreaded Mega 1! ...Hope that you can upgrade the RAM one way or another.

AFA your music needs, try and pick up a copy of NOTATOR SL (3.0 or higher) which is quite the creative tool. With the increased cross-platform popularity of CUBASE the resale price of NOTATOR has plummeted. You don't want to know what I paid for my copy back in 1992...!

Get Devpac:).

Really, I think most TOS compatible applications can only import RTF
format from those applications. I don't have all the current versions
so there may be an exception.

I guess nobody understands it. :-(
Perhaps there where personal adversities that caused it?

>>Perhaps he doesn't have an account that is valid?
> But the email didn't return to me! Strange.

Oh, this is normal to the maus-Net. Because it is a private network the MAUS
(BBS) responds that the email is stored.
If the recipient reads the mail is another story.

> (read your other posting in this thread where you say his account has been
> invalid for a long time, so I guess that mean I won't be getting any

Second had copies of Cubase are pretty hard to find, so I guess you should be happy with whatever you find. Oh, and it does run in 1Meg, but it requires at least 2 for full functionality. Stay away from any pirate copies, as these are very unstable.

You also need a monochrome monitor for most music stuff. Colour won't do.

> a keyboard ?

Well, any Midi keyboard with decent sounds will do. Midi keyboards range from US$200 to US$1500 new, so it all depends on what you're prepared to pay. Do not get one of those PC midi master keyboards unless you also get a seperate sound module, as these have no way to generate sounds.

You also need a couple of midi cables.

There are no non-MS products that read or write Word .doc files, since MS will
no release information on that format and prefer to force other programs to
use the RTF format.

The fact that HDDRIVER supports two IDE/EIDE devices (master and slave)
has no influence at all on the choice of an IDE CDROM driver. You simply
need a CDROM driver that supports your CDROM. HDDRIVER is not involved
in this at all.

>There are no non-MS products that read or write Word .doc files, since MS

As for Papyrus this it not true. Papyrus 5.26 and above can import and export raw MS-Word .doc format. The only restriction is that these documents mustn't saved in fast save mode in Word.

>will no release information on that format

That is a shame but it didn't help them to prevent Papyrus to load their .doc format. ;-)

Well, it depends. ;-)

I'd recommend Boxkite especially for systems with little ram installed.

And its cheaper than freedom and more stable IMHO.

And... Do yourself a favour and forget Selectric. It's old fashioned, not
updated and you can't get a key.

Tschuess,
Frank

>remove his NOVA card ;)

Well, the gist of things is that CAB displays some named colors
incorrectly, especially off-whites (e.g. Ivory, Linen). These and quite a
few others are displayed as pure white. Other non-white colors are
displayed incorrectly, too (e.g. Crimson). Some of the named colors look
exactly the same as others (and not just the whites), but Netscape will
show their sometimes subtle color variances correctly. At first I thought
it was my Nova card but this is not the case. I even did CAB screengrabs
in 24-bit mode to study the RGB values, just in case my aging eyes were
playing tricks <g>. From my experience, sometimes the only way to ensure
proper color representation in CAB is to use a background image instead.

> no design either.

Did I say that your pages are bad? They are not, infact they are quite
good if you
ask me and why do you have to pick on the www.atar.de site all the time?
Don't
you have better things to do? They have made a misstake, but most people
wont even
notice it. Tell them insteed of just saying it's a crap page, as it
isn't. For
a change they even tries to do something usefull with the pages and
offer others
to join them with their own pages under the atari.de domain which is a
great idea.

I have a selection of Atari ST titles for sale.

This List Updated 20/2/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
SCSI external CD-ROM drive, Atari CD ROMS, 16-bit sampler
cartridge/hardware etc...

All are on original media. I may be interested in part exchange/swap W.H.Y.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

>>>>>>>>>> All prices are in UK Pounds (sterling) <<<<<<<<<<
^^^

Prices DO NOT include postage.

GAME COMPILATIONS

Hollywood Collection (5d,ni) 4
Ghostbuster II, Indiana Jones and the Last Crusade & Robocop
TNT (4d) 5
Xybots, Toobin, APB, Dragon Spirit and Hard Drivin'
Finale (4d) 5
Paperboy, Overlander, Ghost'sn' Goblins and Space Harrier (20 levels)
The Dream Team (5d, ds) 5
The Simpsons - Bart v' The Space Mutants, WWF Wrestlemania and

Have you a floppy for the Atari ST disk gone bad, stopped working or unreadable?

Then I may be able to help. As long as the disk is a double density (DD) one. I can work with 51/4 (5.25) and 31/2 (3.5) both single sided or double sided.

Cheers! for now
Steve

I have been reading about this package/hardware SIO2PC
and it states that it is for 8 bit atari systems. Am I correct in
thinking that the ST is a 16 bit system and SIO2PC won't
work on it?

Simon

Absolutely, the ST range and 8 bit range have as much is common as a ZX81 and
a Cray.

If you're looking into tranferring data from a PC to an ST or vice versa,
there are several ways, all described in the Quick FAQ.

Cheers,

Nick.

1 Matrix C110ZV VME graphics card (256 colors out of 16 million)
1280X960 color
at 75hz, mono 4096X4096 at 125hz $350

1 Crazy Dots VME graphics card: $350

1 ISAC MegaBUS graphics card (16 colors out of 4096) 1024X768
(duochromatic) 800X600 at 50hz: $375

Atari DMA bus Ethernet adapters: These adapters work on all Atari ST's
with DMA ports on them. These card wer built by Atari in 1990 to allow
ST's to work over ethernet. These cards require Atari ST external
power supplies (not included) and I have no drivers for these cards, I
have a very limited quantity of these cards: $50 each

NOTE: Attention Mega STE owners, if you intend to purchase a network or
video card, please be certain that you have PALs/TALs installed near
your VME bus port, if the sockets are empty you will need to purchase
these chips. They can be purchased at B&C Atari Sales & Service:
916-295-9270 or www.myatari.com

Shipping: (within the contential US) is $5.00 for USPS Priority shipping

NOTE: Overseas buyers, if you are not in the contential US, shipping
will be $9.00 ground (5-6 weeks) or $14 for air shipping.

Please email me if you are interested in any of the above.

Aloha,
I understand the following, but now here's the weird part.
When I opened up the Supra, I can't find Dip switches OR jumpers.
Also on the inside the drive actually says 54M Atari drive, while the
outside says 30M
I'm real confused....

Is this mandatory? I thought the author of STING said it wasn't. I have a
serial CPX from him that he said should work.

> STING.INF must be edited to point to wherever you put the rest of sting (say
> C:\INTERNET\STING for example).
>

Man, it took me forever to find that out. Well, at least until I downloaded
ST-Guide and read the docs. :)

> All the CPX files go into wherever you usually put your CPX files.
>
> All the STX files go into your STING folder.
>
> DIALER.PRG, DIAL.RSC and DIAL.SCR can go wherever you want. The dialer also
> runs as an ACC if you rename it, so you can put all that in the root
> directory.
>

I have a problem myself: I finally got XCONTROL to load the CPX's, and I got
STING to run and load them. I get two bombs when I try to run DIALER.APP.

I tried using the XCONTROL from the authors page, but it just made my system
reboot. I download the atari xcontrol from umich, and that seems to work okay.
I cannot configure the CPX's however, double clicking results in a big fat zero.

When I run STING.PRG, it does say it loads the modules and finally something
like STING installed...

Here are some of my system specs:

520st 1 meg ram
SHD 20 meg hard drive
I think tos 1.0

I use XBOOT as a bootmanager. Ive tried just about everything I can think of.
Any help would be great!

No, even after having tried it with backwards :(
Also it don't work on a TT030 :(
and yes, it worked on my Mega STE even with the cache set :)
Very very nice game !

Sorry to interrupt, but didn't Le Redacteur import/export MS-Word
files directly? (Hearsay - I've never used it, though I did try a demo
once.)

OTOH to add to the chorus, Papyrus is wonderful, even on a humble ST
as in my case. With the exception of the painfully slow
search/replace, but I can live with that. And the few RTF files I've
tried to import from Word have been fine (using Papyrus 5.15).

If it is the model -1- 8 bits ... too much expansive, we succeeded
last year to find one at $180 at Atari messe of Neuss !
Nevertheless if it is model -2- 24 bits then the price is also higher
than what you can find today ... let's say $250 is a reasonnable
price ...

Of course if you refered to the first market prices, then you are far
below truth it was about $1000 for the 8bits model !!!!!

3582. STiK, STiNG, PPP, FTP

Newsgroup: comp.sys.atari.st
Date: 1998-02-20 00:00:00 UTC
From: grovem@happycampernowridgecrest.ca.us
Message-ID: <6ckv6cmoi1@ash.ridgecrest.ca.us>
Source record: 107234

I managed to get STiK up and running again. I wanted to do this as I have been having problems with three different FTP servers I have accounts on. The problems began after changing from a Slip connection to a PPP connection.

Problems:
One server was having problems with the "ALLO" command before a file was sent. V0.86 of Newsie now allows this command not to be sent, but still transfers were aborted by the server because of "available disk space problems".

The other server would accept the file, but return an invalid directory when NEWSie requested a directory update. This required me to disconnect from the server, then reconnect to view the directory. This had to be done each time.
Also, deleted files left clone files (.nfsxxxx) on the server that had to be renamed then deleted.

Currnet status:
With STiNG removed, and STiK installed, I now have access to all three ftp sites. Upload, download, delete, rename all works fine.

I didn't just try this with NEWSie. I used MGFTP and AFTP. I got the same results before and after I went from a PPP connection to a Slip connection.

So, for what it's worth, John, any FTP problems I mentioned to you about NEWSie don't occure under STiK. (except for the menu/selection/save pref of "send ALLO command" bug I mentioned).

I don't know if it is related to the PPP connection or STiNG (i'm sure someone will point this out:) or some cache problem while using STiNG or what.

I gave up on trying to get a Slip connection with STiNG, as I had problems (probably my own).

NEWSie is cleared of any faults in my book now:).

The internal HD gets its power from the IDE cable. I don't see any way
to get a splitter in unless you use a custom splitter off the main
power supply cable. Not sure if the CD ROM would be too much of a drain,
but it seems like a lot to ask of the Atari power supply. I remember all
the problems with the drain the PC Ditto II caused on the power supply.
Any ideas anyone?

Papyrus, although import/export to PC might be via *.rtf files. But it is a nice word/document processor. I use it all the time for letters, reports etc. Script is, or used to be, simple and fast. There is a new version but I have not tried it.

Get yourself a low wattage (abt 75-100w) supply and a plug to fit the
connector on the motherboard. hook it up and away you go. I ran a ST for
years with just that arrangement. Of course the PS does have to set
outboard. PACMan

I know that the latest version of MagiCMac is OS-8 compatible; you
could get in touch with Systems Solutions or with Computer Direct.

Is it me, or did the message in the thread "Atari Computing issue 8" say
that it's due fir release in February?

We havn't got ours yet, and it's almost March!

>
>Make sure graphics are turned on, as 16 very small GIFs must be viewed to
>help explain things.
>
><< Neil >>
>

I went to your pages using a Hades 060 running in 1024x768xtrue color.
I've used Cab 2.5/MiNT/mintnet/ssl.ovl
These are my findings:
green: second column--->darker
silver: second column--->darker
gray: second column--->paler
olive: second column--->darker
maroon: second column--->darker
navy: second column--->darker
purple: second column--->darker
teal: second column--->darker

Viewed in a 1024x768x256 resolutions I'd the same results except that
the pictures in the second column were badly dithered.

BTW: I viewed the same page with Wensuite 2.40b also. A real disaster.
I really can't understand why some people are using this piece of
crab. Anyway from what I've seem the display isn't correct either.

Have a 520 STfm upgraded w/2.5 megs of Z-ram, internal clock, 2- 720k floppys (1 internal & 1 external), Panasonic KX-1080i printer, both color and monochrome monitors, hundreds of dollars of software w/ manuals. All equipment in like new condition and everything functions perfectly. Complete setup is $75 firm and you pay shipping from the Tampa Bay area. Also have a new (unopened) 20 meg hard drive, bought last week for $75 (have receipt) for an additional $40. If interested drop a line @ 813-319-9101 or scotland1@iname.com

Same here, the only remaining thing to figure out is the FTP
difficulty.

It probably has to do with the ISP's. A PPP connection is definetly
much faster on one of my providers than the other. Slip seems to work
a little better with my Solaris connection. The main difference is
the NT server reports MTU back so I have an idea what my settings
should be. The Sun machine gives no feed back, and according to the
sysadmin, is a personal perference.

I think there is an app that I can drag apps to to kill the process.
But with STiK, a simple stab at the Esc key does the trick right away.
I don't think I would dump N.AES for MagiC just for that purpose:).

Hi everyone!

Is there anyone interested in porting emulators such as Frodo, M.A.M.E.
to the Falcon/ST? Any help or suggestions are appreciated. I've already
a couple of people participating in this project but it would be a lot
easier if you would tell me which computer should be emulated on the ST
or if you can provide any help. Please keep in mind that a Mac or PC
emulator would be nice but it is a far too big to realize.

Greetings,
Matthias

No there isn't, for a start if you would like to post on the internet spamming away at the groups saying "I am participating in an illegal pyrmaid scam and am filling your nesgroup.mailbox with crap" then you can expect someone to be swifty round to knock on your door not to mention the certainaty of revenge attacks and Demon closing your account. For a start look at the scams going on most of them say "I already made x thousand dollars" and yet at that moment they have only just posted the article! IIRC by the time you get to about the 6 level of people posting 200 messages you run out of Usenet, and by about the 13th you run out of people on earth.
See http://www.stopspam.org/usenet/mmf/index.html for more details but basically don't do it and it has nothing to do with the Atari!

Message-ID: <6coc8l$gqa@nntp02.primenet.com>
Source record: 107105

This will be a long post. Read it only if you want to.

Since the topics of sex and guns have been raised, and I know a bit about both of them, here goes.

In ancient Greece, the statues we now think of as pure white were painted in realistic skin tones, whith mucous menbrane a deeper shade of pink, and with hair here, there and everwhere painted in proper and matching colors. Today that is pornography, as found by a rich person of Arabic background when he painted the statues he had acquired in their proper origial colors. That, looking at images of naked bodies, has never been claimed to have harmed young Greeks growing up surrounded by the things. The only difference was that Christianity had not yet been invented.

The reason that pornography is an "I know it when I see it" thing is that it reminds someone of something they would really like to do, if they were not trying to lead a life of denial in order to obtain some future form of life in some unspecified place in return, an idea that was new with Christianity, and also unpleasantly reminds them that they may be wrong about the existence of that future form of life.

That is why different people see different things as pornographic, and why I divide things into things I would like to try and things I would not like to try, and have no presonal idea of what this thing called pornography might really be.

On the second of four topics, the governors of the states of Ohio and Nebraska went on public record as saying they would veto any concealed carry law that arrived on their desks for signature, even if passed unanimously by both houses of the legislatures, and have privately changed their minds. The legislatures of both states are in the process of accumulating votes to try it again. This has no effect on people who carry a gun illegally, and just never get caught at it.

I think that this has to do with a letter I sent, stating the obvious, but at the emotional level of a five-year-old, where politicans and others get stuck. A copy of one of them follows:

6632 Maplewood #106
Sylvania, OH 43560-1838
September 25, 1996

Governor George V. Voinovich
77 S. High Street
Columbus, OH 43215

RE: OH SB 68

Dear Governor Voinovich:

Every study of CCW permits or of a well-armed population ever performed has confirmed something long obvious to any rational person.

Criminals do not stop being criminals, but change to less personally-dangerous forms of crime. Robbery rates go down, burglary rates go up, and the income to criminals, which is about equivalent to the minimum wage, stays the same, while the overall social cost goes down.

There is a reason why you would prefer to have someone killed in a street robbery and never return home to their family, rather than to see them return home and call their insurance company to replace their stolen TV set, and that reason has a name, which can be found in any dictionary.

For personal reasons, I once told a very good waitress named Kathy about the time a very good teacher named Brenda made time for me to show her the safety features of my new pistol, on the evening of her wedding, and watched Kathy recoil in horror, and heard her say "There is no such thing as a safe knife".

That was based on the fact that both the choice of weapon and the anger of a three-and-one-half-year-old at not being treated in a loving manner by their parents, are very close to the surface and instantly available to a middle aged adult's personality.

There are exactly two ways a young human being handles the time between when they have stopped being cute loveable babies and the time when they have developed enough personality to be conversational partners for their parents.

One of them is a resolution to leave and go find whatever you need for yourself, by yourself, and as soon as possible, as both Brenda and I did, and the other is a determination to kill one or both parents, never implemented, because of the feared cost in food and shelter, but never abandoned either, as Kathy had done.

That has the result of being afraid of the presence of arms or armor, because of what you might do if you had access to it, which would be something fatal to someone close to you, which Kathy was. The word for this unfinished childhood business is "hoplophobia".

It is this wish to do harm to others that fuels the choice of public service jobs, such as food service, art, psychotherapy and politics, to balance out altruism and anger in an attempt to attain internal comfort. This does not seem to work for the individuals involved, since anyone comfortable with themselves would not expect others to do harm. One most complains about the things in others that they fear most in themselves.

It would be appreciated by those who know that the police are under no legal duty to protect any particular person if you would not interfere with them taking responsibility for their own protection in a legal manner. You do not have to carry a pistol if you do not want to, and you are free to believe that the police do have a legal duty to protect you, and you can carry around the childhood decision to kill your parents until the day you die.

Very truly yours,

James P. Declercq

Those four topics are sex, guns, drugs, and rock and roll. If anyone wants to talk about drugs and rock and roll, instead of the uses of an incredibly wonderful computer, I am ready and willing, although it is probably off topic.

Papyrus is excellent, I've just used it to layout the majority of pages in
#8 of Atari Computing (out next week!), and it did not crash on me once,
and belive me, I really punished the program!

I hear rumours that the very latest version of Papyrus does have a word
count and also has some form of HTML document handling - sorry I don't know
any more ATM.

I haven't had identical problems but I've given up using STinG when
uploading via FTP. 99 percent of the time the transfer gets stuck at
the end of a file, causing the client to hang, necessitaing its
termination. After reconnecting the file is usually there but 1 byte
too long. This happens with AFTP, Newsie and MG-FTP. I have no similar
problems with STiK, so I switch back to it for uploads (luckily I have
the option).

As you say, downloads etc are fine with STinG.

I did report this to the author of AFTP as I thought it was an AFTP
bug for a while, but having tried Newsie and MG-FTP just lately with
similar results I think it must be a STinG problem.

Peter, can you shed any light?

Cheers,
John

I have one those beetle mouse you mentioned. It is a great mouse. I also have the original atari mouse.
I just bought a cordless trackball from ICD. So I will be willing to sell you my beetle mouse or Atari mouse.

Original Atari Mouse- $10
Beetle Mouse for Atari- $20 (black w/ navy blue)

e-mail me if your interested- fowler@u.arizona.edu

thanx

On 20 Feb 1998 22:50:25, Peter Rottengatter wrote:

]-It mainly depends on HOW you want it. If the telnet is supposed to look and
]-feel like the BBS over phone, there is no way apart from coding the telnet
]-server INTO the BBS binary (the program you launch to start up the BBS).

I was afraid of that...I just don't see Rich Sanchez (whom I have nothing
but the utmost respect for, mind you) investing the time and effort that
would be needed to update BBS Express! ST in that fashion... ;(

]-I have a Telnet server in the works, it's on low priority ATM however. If
]-you install that server, and have a permanent Internet connection, people
]-can log in at any time across the Internet. They'll get a command prompt
]-after login, and they can execute commands, which you provide by placing
]-the corresponding binaries into certain directories. This way you can
]-easily build a telnet based command prompt environment for your BBS.

And to be honest, thats a lot of work, isn't it? (coding all those
binaries, I mean). So I gather when you Telnet into a PC based BBS,
its (more than likely) hardcoded into the software. Oh well, I should
have known. I was hoping it would have been as "simple" as setting up
a second phone line and Atari computer, then networking the 2 via STing
and letting the 2nd system/line be the Internet one, and simply logon
to the first (BBS based) machine, even if it was say, VT100 graphics/plain
ASCII test.

Thank you for taking the time to fill me in on this, Peter...! ;-)

Source record: 107162

I am a new Falcon user(great Machine!!) and I have a problem.
I have recently connected an external SCSI 210mb HD and the computer
doesn't boot directly from it. I must have in the AUTO folder of my
floppy the AHDI.PRG V.6.061 so that it can see the drive, and then
loads the desktop.inf from the HD. But i can't load anything from my
AUTO folder of my HD. I used the ATARI HDutilities to make an bootable
drive, it worked, it placed the HDDRIVER.SYS(i think thats the name)
but still it can't see the HD directly bypassing the floppy.
What must i do?

Thanks for any help.

George

Another user reports that he disables compression in the script file,
then enables it once the dialer is launched. This seemed to cure hangs
with the dialer, and maybe it is an avenue to explore for the ftp
problem. You sound like your having the same difficulty I am.
Damn, I forgot how fast the slip connection is compaired to PPP:).
Another nice thing is being able to instantly terminate while
resolving without having to wait one or two minutes.

Mike

Nova's Video Mode Generator jumps from 2 colors to 256, so I just assumed
16 colors wasn't available. Mind you, the reason I got the card was to
get away from 16 colors, but I'm curious as to how this mode is attained?
Is it through emulator.prg?

If it can work with IDE IDs. I thought it was written primarily for
SCSI IDs.

-> > Also, as I already have the CDROM drive(PC surplus), would the Falcon PSU
-> > be able to power the CDROM via a power splitter cable from the internal HD
-> > power line?

I wouldn't attempt that! The internal hard drive uses 500 mA of
current. That plus the CD ROM will probably overload the power supply
and most likely the tiny wire connecting the hard drive's 5 Volts will
have too much current draw that the voltage will drop.

-> The internal HD gets its power from the IDE cable. I don't see any way
-> to get a splitter in unless you use a custom splitter off the main
-> power supply cable. Not sure if the CD ROM would be too much of a drain,
-> but it seems like a lot to ask of the Atari power supply. I remember all
-> the problems with the drain the PC Ditto II caused on the power supply.
-> Any ideas anyone?

Best Electronics sells such a splitter primarily to connect 3 inch or
larger hard drives. The one I'm looking at in their catalog converts
from the mini 44 pin connector to the larger 40 pin connector and
includes a power cable. It sells for $14.95 U.S. and their part number
is CB 102148. This is for mounting the IDE device outside the Falcon
and I do reccommend an external power supply with it.

Best Electronics address is:

s> My suggestion would be to get XBoot. Happly co-exists with MagiC
s> and everything else :)

Hi!

I'm using XBoot happily on my ST but the Falcon I've just got has Stoop installed. This seems to have the advantage of allowing easy setting of the start-up screen resolution, but only works in 256 colour (and up?). I'm hoping to add MagiC soon. Does Stoop work with that? And anyone know which of these two is preferable - or rather, what are the advantages and disadvantages of either? I suppose as the last resort one could run both - Stoop to set resolution and XBoot to configure the AUTO, CPX etc, but perhaps this is not so necesary with MagiC?

Any info welcome.

Regards
/Peter/

Hi Mike.

I've never used Papyrus but have considered doing so.
I have a question for you: You said

>Papyrus is excellent, I've just used it to layout the majority of >pages in #8 of Atari Computing (out next week!), and it did not >crash on me once, and belive me, I really punished the program!

In issue #7 of AC, a letter from Rod Jenkins states that he cannot get good color picture output quality when using Papyrus. When he add's NVDI to increase picture quality the speed of printing becomes so slow as to make Papyrus unacceptable for use.

Have you experienced the same type of situation as Mr. Jenkins?

Since I do a lot of DTP work, and need a program that will provide good picture output quality, I've considered paying the high price of Papyrus and giving it a try. But if output quality is low and/or speed of printing is too slow, then I think I'll stick with what I'm using.

Just curious as to what experiences you've had with Papyrus since you seem to be doing the same type of work I'll be doing.

Thanks in advance for any help.

In the rare occasion I use STing -most of the time I use MiNT/Mintnet-
I found I couldn't do uploads using aFTP 1.3b (Stik version ofcourse).
Furthermore using POPwatch it takes about 15 seconds before I get connected to my
mailserver. Under MiNT/MiNTnet the connections is immediately.
Nevertheless Peter has done a great job.

Neil,

The number of colors and other parameters are set with the VM generator.
The emulator program just allows you to see part of the boot up
proceedure prior to the actual Nova drivers loading.
It quite easy to use and with the preview feature will let you know if
the settings you are playing with will harm your monitor. If you load
the maximum settings for you monitor into the program it will alert you
if you are trying to exceed any of them. As I work in 800x600 all the
time I have settings for 2,4,16,256, and 65K colors. My card does not
have enought memory to allow 16.7M at 800x600, though I can use it at
600x480.

If you have any questions regarding the VMG's use, send me an e-mail

Steve

>problem.

I don't have compression enabled at all. Which may explain why I've never had any problem with the dialer hanging since PPP was fixed (early versions of PPP would crash the dialer if you tried to connect for a second time without re-booting but PR fixed that ages ago). Must admit I thought that compression only affected SLIP. As my ISP doesn't do CSLIP I've always left it switched off.

The FTP problem manifested itself with SLIP too, as I noticed it early on after I switched to STinG, before PPP worked reliably.

>You sound like your having the same difficulty I am.

Certainly similar ones WRT FTP uploads. Generally I've been very lucky with STinG though. It's worked pretty much as advertised since I first tried it with SLIP (once I'd sussed the bit about loading it after HSmodem). Switching to PPP after Peter fixed it only took a couple of minor alterations to its options and the dial script.

The only client problem I've had is this FTP one.

>Damn, I forgot how fast the slip connection is compaired to PPP:).

Either something is wrong or this is ISP dependent. I don't detect any real speed difference between SLIP and PPP. Others have reported PPP as slightly faster if anything, IIRC.

>Another nice thing is being able to instantly terminate while
>resolving without having to wait one or two minutes.

I'm not quite sure what you mean here. Do you mean terminate a client that is stuck while resolving a hostname before the resolve times out? In that case I'd probably just use MagiC's program manager to kill the locked program. Dirty but effective in emergencies. Not much of a tip if you don't have MagiC, though :-)

THE COMPUTER DUNGEON is happy to announce that our Spring '98 catalogs
are finished and in the process of mailing out.

For information on obtaining **FREE** catalog, please visit:

http://www.mcs.net/~isis/dungeon/dungeon.htm

We also have Issue #7 of Atari Computing in stock. Price is $10.00 plus
$1.50 shipping. Limited quanities so order yours now.

ST Plus Fanzine also in stock; $3.00 per issue which includes shipping or
FREE with any purchase from The Computer Dungeon.

We've added more full version Shareware programs to our listings with more
titles on the way. Please check them out and support the Shareware system.

Thanks for taking the time to read this and look forward to helping you with
all
your Atari needs.

Hi, Everybody!

While updating links for my Falcon Support Page,
I noticed that Wizztronics has announced:
a) the death of the Hawk accelerator, and
b) the development of a TOS/GEM compatible
computer, sporting a 68030 @ 50 MHz with
4 PCI expansion ports.

Has anyone else noticed, and I missed the
discussion, or what?

There were quite a few excellent programs 7 years ago. One of them is Cricit
which is probably overkill. There may be old stock somewhere.

>
>Some nice wants would be:

I would use Cardfile for the above.
There is no good accounts package that I am aware of. I have a few and they
lack many features. There is an Antic program which may suite your needs.
It's last release was version four. Phaser!
>
>
>Is there such an integrated package?

I haven't used Atari Works, but it may be possible for it to do as you desire.
Hope this helps. Best to find old Atari mags and then see if you can track
down the software. THere was also an excellent package out of florida called
lion**** something.

Software has been made but really trickier to find now.
Since it is a Hair Salon, you should be able to modify most software very
easily to fit your needs.

Don't know a lot about this. Do you use Magic? I notice that my
MAGX.INF contains the line:

#_ENV MODEMDEV=U:\DEV\SERIAL2

Maybe you need similar with MODEM2.

>VERY good news indeed :-))). Now we need that english version...

Seconded! Frank, could you please say if v5.26 now supports .wmf import /
export as the W95 version, also word counter?
BTW Papyrus v5.15, `the last english version, CAN export import Word 8.00
files in RTF, well, however selecting "MS Windows Codeseite 1252 (ANSI)" as the RTF
export (from the options menu) allows export to Word 8 and will keep table
information and styling intact.' Quoted from Papyrus.hyp R1.2 (I'm the
author).

Cleaning up my message base, I re-discover this old message. I've noticed
exactly the same thing as you. No problem if the original Magic's shutdown
is used, only with the new 1.6. I've renamed the STinG's one to
stingdwn.prg in the stop folder and it seams to work.

Bye,
/Pascal/

Hi Neil. Just tested your cab color page. There is no difference that
I can complain about. All colors look just the same on my system.

Falcon 030. Screen 800 x 600. 256 colors. CAB 2.6. NVDI 1.12

cheers Joergen

That game sure was unplayable on an ST!

>It's amazing ! Which set-up have you used to make it run ?

It even ran on my Falcon+AB040 without any setup program. I might have
patched it a bit, but I don't think so (I did unpack the executable, though).

One of the caches needed to be turned off (data, I think), since it otherwise
kept returning to the options screen all the time (probably the MOVEM bug),
but it was still _very_ nice and fluid. :-)

Nowadays I only play games on my PC, but I spent _lots_ of hours on Frontier.
IIRC, I was close to the level below Elite when I last played (still without
a criminal record) and had lots of cash (using no cheating whatsoever).
Too bad the space battles were so simple (only one enemy at a time). It got
quite boring after killing hundreds (?) of pirates and others. Unfortunately,
the military powers didn't like me at all, so I never got any interesting
assignments from them (I guess I switched sides too often early in the game).

I'm having ftp problems with the Sting/Newsie combo as well.
ftp.uni-kl.de, ftp.maus.de and ftp.uni-paderborn.de cannot be accessed
with Newsie under Sting/PPP but works fine with Stik/slip.
For some time, I thought the problem was in Sting or the resolve
module, but then I tried with Aftp and Mgftp. They both connect to
the above mentioned servers under Sting/PPP.
I've mailed John about this.

Another ftp site I tried yesterday didn't work with any of the ftp
clients. But Fetch on a Mac got the files I needed.
ftp.youngchang.com/Kurzweil/Pro/K2000-K2vx-K2500/K2500/
Operating System/

Newsie got as far as to the K2500 directory, but couldn't open the
/Operating System/ dir. None of the other clients could either...
